- 10 - SPEED CONTROL CABLE

(9) Using finger pressure only, disconnect end of servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 16). **DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(10) Position battery tray up far enough for access to speed control servo electrical connector and vacuum line.

(11) Disconnect electrical connector and vacuum line at servo.

(12) Position battery tray with attached servo assembly to gain access to 2 servo mounting nuts (Fig. 18) or (Fig. 19).

(13) Remove 2 mounting nuts holding servo cable sleeve to bracket (Fig. 19).

(14) Pull speed control cable sleeve and servo away from servo mounting bracket to expose cable retaining clip (Fig. 19) and remove clip. Note: The servo mounting bracket displayed in (Fig. 19) is a typical bracket and may/may not be applicable to this model vehicle.

(15) Remove servo from mounting bracket. While removing, note orientation of servo to bracket.

**Fig. 17 Servo Location—Removal/Installation**

- 1 - BATTERY TRAY
- 2 - SERVO ELECTRICAL CONNECTOR
- 3 - SERVO BRACKET SCREWS (3)

INSTALLATION**V-6/V-8 ENGINES**

- (1) Position servo to mounting bracket.
- (2) Align hole in cable connector with hole in servo pin. Install cable-to-servo retaining clip.
- (3) Insert servo studs through holes in servo mounting bracket.
- (4) Insert servo studs through holes in servo cable sleeve.
- (5) Install servo mounting nuts and tighten to 8.5 N·m (75 in. lbs.) torque.
- (6) Connect vacuum line to servo.
- (7) Connect electrical connector to servo terminals.
- (8) Install three bolts retaining servo/servo mounting bracket to battery tray.
- (9) Connect servo cable to throttle body. Refer to Servo Cable Removal/Installation in this group.
- (10) Connect negative battery cable to battery.
- (11) Before starting engine, operate accelerator pedal to check for any binding.

8.0L V-10 ENGINE

- (1) Position servo to mounting bracket.
- (2) Align hole in cable connector with hole in servo pin. Install cable-to-servo retaining clip.
- (3) Insert servo studs through holes in servo mounting bracket.
- (4) Insert servo studs through holes in servo cable sleeve.
- (5) Install servo mounting nuts and tighten to 8.5 N·m (75 in. lbs.) torque.
- (6) Connect vacuum line to servo.
- (7) Connect electrical connector to servo terminals.
- (8) Connect servo cable to throttle body. Refer to Servo Cable Removal/Installation in this group.
- (9) Install battery tray. Tighten all battery tray mounting hardware to 16 N·m (140 in. lbs.) torque.
- (10) Position battery into battery tray.
- (11) If equipped, install battery heat shield.
- (12) Install battery holddown clamp. Tighten bolt to 4 N·m (35 in. lbs.) torque.
- (13) Connect positive battery cable to battery.
- (14) Connect negative battery cable to battery.
- (15) Before starting engine, operate accelerator pedal to check for any binding.

INSTALLATION - DIESEL WITH AUTO. TRANS.

- (1) Position servo to mounting bracket.
- (2) Align hole in cable connector with hole in servo pin. Install cable-to-servo retaining clip.
- (3) Insert servo studs through holes in servo mounting bracket.
- (4) Insert servo studs through holes in servo cable sleeve.
- (5) Install servo mounting nuts and tighten to 8.5 N·m (75 in. lbs.) torque.
- (6) Connect vacuum line to servo.
- (7) Connect electrical connector to servo terminals.
- (8) Connect servo cable to throttle lever by pushing cable connector rearward onto lever pin while holding lever forward.
- (9) Install battery tray. Tighten all battery tray mounting hardware to 16 N·m (140 in. lbs.) torque.
- (10) Position battery into battery tray.
- (11) If equipped, install battery heat shield.
- (12) Install battery holddown clamp. Tighten bolt to 4 N·m (35 in. lbs.) torque.
- (13) Connect positive battery cable to battery.
- (14) Connect negative battery cables to both batteries.
- (15) Before starting engine, operate accelerator pedal to check for any binding.
- (16) Install cable/lever cover.

SWITCH

DESCRIPTION

Gas Engines and Diesel With Auto. Trans.

There are two separate switch pods that operate the speed control system. The steering-wheel-mounted switches use multiplexed circuits to provide inputs to the Powertrain Control Module (PCM) for ON, OFF, RESUME, ACCELERATE, SET, DECEL and CANCEL modes. Refer to the owner's manual for more information on speed control switch functions and setting procedures.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

Diesel With Manual Trans.

There are two separate switch pods that operate the speed control system. The steering-wheel-mounted switches use multiplexed circuits to provide inputs to the Engine Control Module (ECM) for ON, OFF, RESUME, ACCELERATE, SET, DECEL and CANCEL modes. Refer to the owner's manual for more information on speed control switch functions and setting procedures.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

OPERATION

Gas Engines and Diesel With Auto. Trans.

When speed control is selected by depressing the ON, OFF switch, the Powertrain Control Module (PCM) allows a set speed to be stored in its RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between approximately 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral. The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch. The speed control can be disengaged also by any of the following conditions:
 - An indication of Park or Neutral
 - The vehicle speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low)
 - Depressing the clutch pedal.
 - Excessive engine rpm (indicates that the transmission may be in a low gear)

- The vehicle speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)

- If the actual speed is not within 20 mph of the set speed. The previous disengagement conditions are programmed for added safety.

Once the speed control has been disengaged, depressing the ACCEL switch restores the vehicle to the target speed that was stored in the PCM's RAM.

NOTE: Depressing the OFF switch will erase the set speed stored in the PCM's RAM.

If, while the speed control is engaged, the driver wishes to increase vehicle speed, the PCM is programmed for an acceleration feature. With the ACCEL switch held closed, the vehicle accelerates slowly to the desired speed. The new target speed is stored in the PCM's RAM when the ACCEL switch is released. The PCM also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the ACCEL switch.

The PCM also provides a means to decelerate without disengaging speed control. To decelerate from an existing recorded target speed, depress and hold the COAST switch until the desired speed is reached. Then release the switch. The ON, OFF switch operates two components: the PCM's ON, OFF input, and the battery voltage to the brake switch, which powers the speed control servo.

Diesel With Manual Trans.

When speed control is selected by depressing the ON, OFF switch, the Engine Control Module (ECM) allows a set speed to be stored in its RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between approximately 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied. The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch. The speed control can be disengaged also by any of the following conditions:
 - The vehicle speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low)
 - Depressing the clutch pedal.
 - Excessive engine rpm (indicates that the transmission may be in a low gear)
 - The vehicle speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)

SWITCH (Continued)

- If the actual speed is not within 20 mph of the set speed, the previous disengagement conditions are programmed for added safety.

Once the speed control has been disengaged, depressing the ACCEL switch restores the vehicle to the target speed that was stored in the ECM's RAM.

NOTE: Depressing the OFF switch will erase the set speed stored in the ECM's RAM.

If, while the speed control is engaged, the driver wishes to increase vehicle speed, the ECM is programmed for an acceleration feature. With the ACCEL switch held closed, the vehicle accelerates slowly to the desired speed. The new target speed is stored in the ECM's RAM when the ACCEL switch is released. The ECM also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the ACCEL switch.

The ECM also provides a means to decelerate without disengaging speed control. To decelerate from an existing recorded target speed, depress and hold the COAST switch until the desired speed is reached. Then release the switch. The ON, OFF switch operates two components: the ECM's ON, OFF input, and the battery voltage to the brake switch, which powers the speed control servo.

REMOVAL

WARNING: BEFORE BEGINNING ANY AIRBAG SYSTEM COMPONENT REMOVAL OR INSTALLATION, REMOVE AND ISOLATE THE NEGATIVE (-) CABLE(S) FROM THE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. THEN WAIT TWO MINUTES FOR SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE INJURY.

- (1) Disconnect and isolate negative battery cable(s).
- (2) Remove airbag module. Refer to 8, Restraint Systems for procedures.
- (3) Remove switch-to-steering wheel mounting screws (Fig. 20).
- (4) Remove switch.
- (5) Remove electrical connector at switch.

INSTALLATION

- (1) Install electrical connector to switch.
- (2) Install switch and mounting screws.
- (3) Tighten screws to 3 N·m (26 in. lbs. +/- 2 in. lbs.) torque.

80a6f161

Fig. 20 Speed Control Switches

- 1 - MOUNTING SCREWS (2)
2 - SPEED CONTROL SWITCHES (2)

(4) Install airbag module. Refer to 8, Restraint Systems for procedures.

(5) Connect negative battery cable(s).

VACUUM RESERVOIR

DESCRIPTION

Gasoline Powered Engines : A vacuum reservoir is used to supply the vacuum needed to maintain proper speed control operation when engine vacuum drops, such as in climbing a grade while driving. A one-way check valve is used in the vacuum line between the reservoir and the vacuum source. This check valve is used to trap engine vacuum in the reservoir. On certain vehicle applications, this reservoir is shared with the heating/air-conditioning system. The vacuum reservoir cannot be repaired and must be replaced if faulty.

Diesel Powered Engines With Auto. Trans. : A vacuum reservoir is not used if equipped with a diesel powered engine. Instead, an engine driven pump (vacuum pump) is used to supply vacuum for speed control operation. This vacuum pump is used with the diesel engine only if it is equipped with an automatic transmission. Refer to Vacuum Pump in 9, Engines for information.

REMOVAL

The vacuum reservoir is located under the plastic cowl plenum cover at lower base of windshield. The vacuum reservoir is not used if equipped with a diesel engine.

VACUUM RESERVOIR (Continued)

- (1) Disconnect and isolate battery negative cable.
- (2) Remove both windshield wiper arm/blade assemblies. Refer to 8, Wiper and Washer Systems.
- (3) Remove rubber weather-strip at front edge of cowl grill (Fig. 21).

**Fig. 21 Cowl Grille Panel Weather-strip**

- 1 - COWL GRILLE
2 - WEATHERSTRIP

- (4) Release cowl grill plastic anchor screws (Fig. 22).
- (5) Lift cowl plenum cover/grille panel from vehicle far enough to access vacuum reservoir.
- (6) Disconnect vacuum supply line from vacuum reservoir (Fig. 23).
- (7) Remove 2 vacuum reservoir mounting screws.
- (8) Remove vacuum reservoir from vehicle.

INSTALLATION

The vacuum reservoir is located under the plastic cowl plenum cover at lower base of windshield. The vacuum reservoir is not used if equipped with a diesel engine.

- (1) Install vacuum reservoir and two mounting screws. Tighten screws to 2.2 N·m (20 in. lbs.) torque.
- (2) Connect vacuum supply hose to vacuum reservoir.
- (3) Position cowl plenum cover/grille panel to vehicle.
- (4) Install and tighten cowl cover fasteners to vehicle body.
- (5) Install rubber weather-strip at front edge of cowl grill.
- (6) Install windshield wiper arms. Refer to 8, Wiper and Washer Systems.

**Fig. 22 Plastic Anchor Screws Remove/Install**

- 1 - PLASTIC SCREW ANCHOR
2 - COWL GRILLE

**Fig. 23 Vacuum Reservoir Remove/Install**

VEHICLE THEFT SECURITY SYSTEM.....	3	VTSS INDICATOR	3

VEHICLE THEFT SECURITY

DESCRIPTION

The Vehicle Theft Security System (VTSS) is an available factory-installed option on this model when it is also equipped with the high-line or premium Central Timer Module (CTM). The VTSS is designed to provide perimeter protection against unauthorized use or tampering by monitoring the vehicle doors and the ignition system. If unauthorized vehicle use or tampering is detected, the system responds by pulsing the horn, flashing the headlamps, and preventing the engine from operating.

The VTSS includes the following major components, which are described in further detail elsewhere in this service manual:

- **Central Timer Module** - The high-line or premium Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. The high-line or premium CTM contains a microprocessor and software that allow it to provide many electronic functions and features not available with base version of the CTM, including the VTSS. The CTM provides all of the proper VTSS features and outputs based upon the monitored inputs. The CTM circuitry monitors hard wired switch inputs, as well as message inputs received from other vehicle electronic modules over the Chrysler Collision Detection (CCD) data bus network. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODULE - DESCRIPTION).

- **Door Ajar Switch** - A door ajar switch is located on the hinge pillar of each front door in the vehicle. These switches provide an input to the VTSS indicating whether the door is opened or closed. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOOR AJAR SWITCH - DESCRIPTION).

- **Door Cylinder Lock Switch** - A door cylinder lock switch is located on the back of each front door lock cylinder. This switch provides an input to the

VTSS indicating whether the system should remain armed or be disarmed. (Refer to 8 - ELECTRICAL/POWER LOCKS/DOOR CYLINDER LOCK SWITCH - DESCRIPTION).

- **Horn Relay** - The horn relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery. The horn relay is normally activated by the horn switch to control the sounding of the vehicle horn or horns. However, it can also be activated by an output of the Central Timer Module (CTM) to provide an audible indication that unauthorized vehicle use or tampering has been detected. (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - DESCRIPTION).

- **Headlamp Relay** - The headlamp relay (also known as the security relay) is located in the Power Distribution Center (PDC) in the engine compartment near the battery. The headlamp relay is normally activated by the Central Timer Module (CTM) based upon inputs from the Remote Keyless Entry (RKE) panic mode feature. However, it can also be activated by an output of the CTM to flash the headlamp low beams to provide a highly visible indication that unauthorized vehicle use or tampering has been detected. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP RELAY - DESCRIPTION).

- **VTSS Indicator** - A red Light Emitting Diode (LED) located on the lower surface of the overhead console near the windshield is illuminated by an output of the Central Timer Module (CTM) to indicate the status of the VTSS. This LED is integral to the electronic circuit board for the Compass Mini-Trip Computer (CMTC). (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/COMPASS/MINI-TRIP COMPUTER - DESCRIPTION).

The engine no-run feature of the VTSS relies upon communication between the high-line or premium CTM and the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus network.

Hard wired circuitry connects many of the VTSS components to each other through the electrical sys-

VEHICLE THEFT SECURITY (Continued)

tem of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the VTSS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

A Central Timer Module (CTM) is used on this model to control and integrate many of the electronic functions and features included in the Vehicle Theft Security System (VTSS). In the VTSS, the CTM receives inputs indicating the status of the door ajar switches, the door cylinder lock switch, and the ignition switch. The programming in the CTM allows it to process the information from all of these inputs and send control outputs to energize or de-energize the horn relay, the headlamp relay, and the VTSS indicator. The control of these inputs and outputs are what constitute all of the features of the VTSS. Following is information on the operation of each of the VTSS features. Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the VTSS.

ENABLING

The high-line or premium version of the CTM must have the VTSS function electronically enabled in order for the VTSS to perform as designed. The logic in the CTM keeps its VTSS function dormant until it is enabled using a DRBIII® scan tool. The VTSS function of the high-line or premium CTM is enabled on vehicles equipped with the VTSS option at the factory, but a service replacement CTM must be VTSS-enabled by the dealer using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

The VTSS engine no-run feature is disabled when it is shipped from the factory. This is done by programming within the Powertrain Control Module (PCM). The logic in the PCM prevents the VTSS engine no-run feature from arming until the engine start counter within the PCM sees twenty engine starts. The VTSS no-run feature must be enabled by the dealer when the vehicle is received from the assembly plant. Once the VTSS engine no-run feature has been enabled, it cannot be disabled unless the PCM is replaced with a new unit. The same

VTSS engine no-run feature enable logic will apply anytime the PCM is replaced with a new unit.

ARMING

Passive arming of the VTSS occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps are turned off, and the doors are locked while they are open using the power lock switch, or locked after they are closed by turning either front door lock cylinder to the lock position using the key. The power lock switch will not function if the key is in the ignition switch or the headlamps are turned on with the driver side front door open. The VTSS will not arm if the doors are locked using the mechanical lock button. Active arming of the VTSS occurs when the "Lock" button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors must be closed and the ignition switch must be in the Off position when the RKE transmitter "Lock" button is depressed. However, once the VTSS arming process has been completed, the ignition switch can be turned to the Accessory position without triggering the alarm.

Once the VTSS begins passive or active arming, the security indicator lamp in the overhead console will flash rapidly for about fifteen seconds. This indicates that the VTSS arming is in progress. Turning a key in the ignition switch, opening a door, or unlocking a door by any means during the fifteen second arming process will cause the VTSS indicator to stop flashing and the arming process to abort. Once the fifteen second arming function is successfully completed, the indicator will flash at a slower rate, indicating that the VTSS is armed.

DISARMING

Passive disarming of the VTSS occurs when the vehicle is unlocked using the key to unlock either front door. Active disarming of the VTSS occurs when the vehicle is unlocked by depressing the "Unlock" button of the RKE transmitter. Once the alarm has been activated (horn pulsing, headlamps flashing, and the engine no-run feature), either disarming method will also deactivate the alarm. Depressing the "Panic" button on the RKE transmitter will **not** disarm the VTSS.

POWER-UP MODE

When the armed VTSS senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode the alarm system remains armed following a battery failure or disconnect. If the VTSS was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The pow-

VEHICLE THEFT SECURITY (Continued)

er-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The engine no-run feature will prevent the engine from starting until the alarm system has been actively or passively disarmed. The VTSS will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTSS is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

TAMPER ALERT

The VTSS tamper alert feature will sound the horn three times upon disarming, if the alarm was triggered and has since timed-out (about fifteen minutes). This feature alerts the vehicle operator that the VTSS alarm was activated while the vehicle was unattended.

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

The VTSS-related hard wired inputs to and outputs from the high-line or premium Central Timer Module (CTM) may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the CTM, the Powertrain Control Module (PCM), or the Chrysler Collision Detection (CCD) data bus network. In order to obtain conclusive testing of the VTSS, the CTM, the PCM, and the CCD data bus network must also be checked. The most reliable, efficient, and accurate means to diagnose the VTSS requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. The DRBIII® scan tool can provide confirmation that the CCD data bus network is functional, that all of the electronic modules are sending and receiving the proper messages over the CCD data bus, and that these modules are receiving the proper hard wired inputs and responding with the proper hard wired outputs needed to perform their functions. See the "Vehicle Theft Security System" menu item on the DRBIII® scan tool.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISO-

LATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

VTSS INDICATOR

DESCRIPTION

The Vehicle Theft Security System (VTSS) indicator consists of a red Light-Emitting Diode (LED) located on the electronic circuit board of the Compass Mini-Trip Computer (CMTC) within the overhead console. The LED extends through a hole in the CMTC lens located near the forward end of the overhead console housing near the windshield.

The VTSS indicator cannot be adjusted or repaired and, if faulty or damaged, the entire CMTC unit must be replaced. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/COMPASS/MINI-TRIP COMPUTER - DESCRIPTION).

OPERATION

The Vehicle Theft Security System (VTSS) indicator gives a visible indication of the VTSS arming status. One side of Light-Emitting Diode (LED) in the VTSS indicator is connected to battery current through a fused B(+) circuit and a fuse in the Junction Block (JB), so the indicator remains functional regardless of the ignition switch position. The other side of the LED is hard wired to the Central Timer Module (CTM), which controls the operation of the VTSS indicator by pulling this side of the LED circuit to ground. When the VTSS arming is in progress, the CTM will flash the LED rapidly on and off for about fifteen seconds. When the VTSS has been successfully armed, the CTM will flash the LED on and off continually at a much slower rate until the VTSS has been disarmed. The VTSS indicator can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - VTSS INDICATOR

The diagnosis found here addresses an inoperative Vehicle Theft Security System (VTSS) indicator condition. If the problem being diagnosed is related to indicator accuracy, be certain to confirm that the problem is with the indicator and not with an inoperative VTSS. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY SYSTEM- DIAGNOSIS AND

VTSS INDICATOR (Continued)

TESTING). If no VTSS problem is found, the following procedure will help to locate a short or open in the VTSS indicator control circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused B(+) fuse (Fuse 12 - 10 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse (Fuse 12 - 10 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit between

the JB and the Power Distribution Center (PDC) as required.

(3) Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the Compass Mini-Trip Computer (CMTC) from the CMTC connector receptacle. Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the body wire harness connector for the CMTC. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit between the CMTC indicator and the JB as required.

(4) Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector (Connector C2) for the Central Timer Module (CTM) from the CTM connector receptacle. Check for continuity between the VTSS indicator driver circuit cavity of the body wire harness connector for the CMTC and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted VTSS indicator driver circuit between the CMTC and the CTM as required.

(5) Check for continuity between the VTSS indicator driver circuit cavities of the instrument panel wire harness connector (Connector C2) for the CTM and the body wire harness connector for the CMTC. There should be continuity. If OK, replace the faulty CMTC indicator. If not OK, repair the open VTSS indicator driver circuit between the CMTC and the CTM as required.

WIPERS/WASHERS

DESCRIPTION

An electrically operated intermittent wiper and washer system is standard factory-installed safety equipment on this model. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Central Timer Module** - The Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. A base version of the CTM is used on base models of this vehicle. The base version of the CTM combines the functions of a chime module and an intermittent wipe module in a single unit. The high-line version of the CTM is used on high-line vehicles. The high-line CTM provides all of the functions of the base version of the CTM, but also is used to control and integrate many additional

electronic functions and features included on high-line models. The premium version of the CTM is the same as the high-line version, but is used only on models equipped with the heated seat option. The high-line and premium versions of the CTM contain integrated circuitry, a central processing unit and the programming to provide all of the proper wiper and washer system features based upon the monitored inputs. The high-line and premium CTM circuitry monitors hard wired switch inputs, as well as message inputs received from other vehicle electronic modules on the Chrysler Collision Detection (CCD) data bus network. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODULE - DESCRIPTION).

- **Multi-Function Switch** - The multi-function switch is secured to the left side of the steering column, just below the steering wheel. Only the control stalk for the multi-function switch is visible, the remainder of the switch is concealed beneath the steering column shrouds. The multi-function switch

WIPERS/WASHERS (Continued)

contains all of the switches for both the wiper and washer systems.

- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower rear side of the washer reservoir, above the washer pump/motor unit near the left front corner of the engine compartment.

- **Washer Nozzles** - The dual fluidic washer nozzles are secured with integral snap features to dedicated openings in the cowl plenum cover/grille panel located near the base of the windshield. The washer plumbing fittings for the washer nozzles are concealed beneath the cowl plenum cover/grille panel.

- **Washer Pump/Motor** - The washer pump/motor unit is located in a dedicated hole on the lower rear side of the washer reservoir near the left front corner of the engine compartment.

- **Washer Reservoir** - The washer reservoir is secured to the left side of the radiator fan shroud in the left front corner of the engine compartment.

- **Wiper Arms** - The two wiper arms are secured to the two wiper pivots, which extend through the cowl plenum cover/grille panel located near the base of the windshield.

- **Wiper Blades** - The two wiper blades are secured to the two wiper arms, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.

- **Wiper Module** - The wiper pivots are the only visible components of the wiper module. The remainder of the module is concealed within the cowl plenum beneath the cowl plenum cover/grille panel. The wiper module includes the module bracket, the single wiper motor, the wiper linkage, and the two wiper pivots.

- **Wiper Relay** - The wiper relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery.

Features of the wiper and washer system include the following:

- **Continuous Wipe Modes** - The two-speed wiper motor and the internal circuitry of the multi-function switch work in concert to provide two continuous wipe cycles, low speed or high speed.

- **Intermittent Wipe Mode** - The internal circuitry of the multi-function switch, the CTM, and the wiper relay work in concert to provide an intermittent wipe mode with multiple delay interval selections. On models with a high-line or premium CTM, the CTM also automatically adjusts each manually selected delay interval to compensate for vehicle speed.

- **Washer Mode** - When the washer system is activated with the multi-function switch while the wiper system is operating, washer fluid will be dispensed onto the windshield glass through the washer

nozzles for as long as the washer pump/motor is energized.

- **Wipe-After-Wash Mode** - The internal circuitry of the CTM provides a wipe-after-wash feature which, if the wipers are turned Off, will operate the washer pump/motor and the wipers for as long as the washer system is activated, then provide several additional wipe cycles after the washer system is deactivated before parking the wiper blades near the base of the windshield.

Hard wired circuitry connects the wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The wiper and washer system is intended to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outside windshield glass surface that might be encountered while driving the vehicle under numerous types of inclement operating conditions. The vehicle operator initiates all wiper and washer system functions with the multi-function switch control stalk that extends from the left side of the steering column, just below the steering wheel. Rotating the knob on the end of the multi-function switch control stalk selects the desired wiper system operating mode. The wiper system allows the vehicle operator to select from two continuous wiper speeds, Hi or Lo, or one of several intermittent wipe Delay mode intervals. Pushing the button on the end of the control stalk downwards towards the steering column

WIPERS/WASHERS (Continued)

activates the washer pump/motor, which dispenses washer fluid onto the windshield glass through the washer nozzles.

When the ignition switch is in the Accessory or On positions, battery current from a fuse in the Junction Block (JB) is provided through a fused ignition switch output (run-acc) circuit to the wiper motor park switch, the wiper relay, and the multi-function switch. The internal circuitry of the multi-function switch provides a direct hard wired battery current output to the low speed or high speed brushes of the wiper motor when the Lo or Hi switch setting is selected, which causes the wipers to cycle at the selected speed. The intermittent wipe, and wipe-after-wash features of the wiper and washer system are provided by the electronic intermittent wipe logic circuit within the Central Timer Module (CTM). In order to provide the intermittent wipe feature, the CTM monitors the wiper switch state and the wiper motor park switch state. In order to provide the wipe-after-wash feature, the CTM monitors both the washer switch state and the wiper motor park switch state. When a Delay position is selected with the multi-function switch control knob, the CTM logic circuit responds by calculating the correct delay interval. The CTM then energizes the wiper relay by pulling the relay control coil to ground. The energized wiper relay directs battery current through the normally open contact of the relay back through the internal circuitry of the multi-function switch to the low speed brush of the wiper motor. The CTM monitors the wiper motor operation through the wiper park switch sense circuit, which allows the CTM to determine the proper timing to begin the next wiper blade sweep. The normal delay intervals are driver adjustable from about one-half second to about eighteen seconds.

The high-line and premium CTM also provides a speed sensitive intermittent wipe feature. By monitoring vehicle speed messages received from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus network, the high-line or premium CTM is able to adjust the delay intervals to compensate for vehicle speed. Above about sixteen kilometers-per-hour (ten miles-per-hour) the delay is driver adjustable from about one-half second to about eighteen seconds. Below about sixteen kilometers-per-hour (ten miles-per-hour) the delay times are doubled by the CTM, from about one second to about thirty-six seconds.

When the Off position of the multi-function switch wiper control knob is selected, one of two events is possible. The event that will occur depends upon the position of the wiper blades on the windshield at the moment that the Off position is selected. If the wiper blades are in the down position on the windshield

when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is closed to battery current through a fused ignition switch output (run-acc) circuit. The park switch sense circuit directs this battery current to the low speed brush of the wiper motor through the normally closed contact of the wiper relay and the internal Off position circuitry of the multi-function switch. This causes the wiper motor to continue running until the wiper blades are in the down position on the windshield and the park switch is again closed to ground.

When the Wash position of the multi-function switch is selected, the Wash position circuitry within the switch directs battery current to the washer pump/motor. The CTM monitors the washer switch state through a washer switch sense input. When the washer switch is closed with the wiper system turned Off, the CTM operates the wiper motor through the wiper relay in the same manner as it does to provide the Delay mode operation. After the state of the washer switch changes to open, the CTM monitors the wiper motor through the wiper park switch sense circuit, which allows the CTM to monitor the number of wiper blade sweeps.

Proper testing of the CTM, the PCM, or the CCD data bus vehicle speed messages requires a DRBIII® scan tool. Refer to the appropriate diagnostic information. Refer to the owner's manual in the vehicle glove box for more information on the features and operation of the wiper and washer system.

DIAGNOSIS AND TESTING - WIPER & WASHER SYSTEM

WIPER SYSTEM

The diagnosis found here addresses an electrically inoperative wiper system. If the wiper motor operates, but the wipers do not move on the windshield, replace the faulty wiper module. If the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper system components as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSPECTION) and (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The following tests will help to diagnose the hard wired components and circuits of the wiper system.

WIPERS/WASHERS (Continued)

However, these tests may not prove conclusive in the diagnosis of this system on models equipped with a high-line or premium Central Timer Module (CTM). In order to obtain conclusive testing of the wiper system on models with a high-line or premium CTM, the Chrysler Collision Detection (CCD) data bus network and all of the electronic modules that provide inputs to or receive outputs from the wiper system components must be checked. The most reliable, efficient, and accurate means to diagnose the wiper system on models with a high-line or premium CTM requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. The DRBIII® scan tool can provide confirmation that the CCD data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CCD data bus, and that the wiper relay is being sent the proper hard wired outputs by the CTM for it to perform its wiper system functions.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused ignition switch output (run-acc) fuse (Fuse 6 - 25 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) fuse (Fuse 6 - 25 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused ignition switch output (run-acc) circuit between the JB and the ignition switch as required.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector for the multi-function switch from the switch connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) circuit cavity of the instrument panel wire harness connector for the multi-function switch. If OK, go to Step 4. If not OK, repair the

open fused ignition switch output circuit between the multi-function switch and the JB as required.

(4) If the problem being diagnosed involves only the intermittent wipe feature, go to Step 5. If the problem being diagnosed involves all wiper modes, or only the Low and/or High speed modes, go to Step 7.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector (Connector C1) for the Central Timer Module (CTM) from the CTM connector receptacle. Check for continuity between the wiper switch mode sense circuit cavities of the instrument panel wire harness connector for the multi-function switch and the instrument panel wire harness connector (Connector C1) for the CTM. There should be continuity. If OK, go to Step 6. If not OK, repair the open wiper switch mode sense circuit between the multi-function switch and the CTM as required.

(6) Check for continuity between the wiper switch mode signal circuit cavities of the instrument panel wire harness connector for the multi-function switch and the instrument panel wire harness connector (Connector C1) for the CTM. There should be continuity. If OK, proceed to the diagnosis for the wiper relay. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER RELAY - DIAGNOSIS AND TESTING). If not OK, repair the open wiper switch mode signal circuit between the multi-function switch and the CTM as required.

(7) Check for continuity between the two wiper switch low speed output circuit cavities of the instrument panel wire harness connector for the multi-function switch. There should be continuity. If OK, go to Step 8. If not OK, repair the open wiper switch low speed output circuit between the two cavities of the instrument panel wire harness connector for the multi-function switch as required.

(8) Test the multi-function switch continuity. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). If the multi-function switch tests OK, reconnect the instrument panel wire harness connector for the multi-function switch to the switch connector receptacle and go to Step 9. If not OK, replace the faulty multi-function switch and test the wiper system operation again. If still not OK, go to Step 9.

(9) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Measure the resistance between the headlamp and dash wire harness ground wire for the wiper motor and a good ground. The meter should read zero ohms. If OK, go to Step 10. If not OK, repair the open ground circuit to ground (G100) as required.

WIPERS/WASHERS (Continued)

(10) Disconnect the headlamp and dash wire harness connector for the wiper module from the wiper motor pigtail wire connector. Reconnect the battery negative cable. Turn the ignition switch to the On position. Place the multi-function switch in the positions indicated in the tests below, and check for battery voltage at the appropriate cavity of the headlamp and dash wire harness connector for the wiper motor.

(a) Check for battery voltage at the fused ignition switch output (run-acc) circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in any position. If OK, go to Step b. If not OK, repair the open fused ignition switch output (run-acc) circuit between the wiper module and the JB as required.

(b) Check for battery voltage at the wiper switch low speed output circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in the Lo position. If OK, go to Step c. If not OK, repair the open wiper switch low speed output circuit between the wiper module and the multi-function switch as required.

(c) Check for battery voltage at the wiper switch high speed output circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in the Hi position. If OK, go to Step d. If not OK, repair the open wiper switch high speed output circuit between the wiper module and the multi-function switch as required.

(d) Check for battery voltage at the wiper park switch sense circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in the Lo or Hi position, then move the switch to the Off position. The meter should switch between battery voltage and zero volts while the wipers are cycling. The meter should read battery voltage when the switch is first moved to the Off position until the wipers park, and then read a steady zero volts. If not OK, replace the faulty wiper module.

WASHER SYSTEM

The diagnosis found here addresses an electrically inoperative washer system. If the washer pump/motor operates, but no washer fluid is emitted from the washer nozzles, be certain to check the fluid level in the reservoir. Also inspect the washer system components as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSPECTION). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness

routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Turn the ignition switch to the On position. Turn the multi-function switch wiper control knob to the Lo or Hi speed position. Check whether the wipers operate. If OK, go to Step 2. If not OK, repair the wiper system as required before proceeding with the following tests. Refer to WIPER SYSTEM .

(2) Turn the multi-function switch wiper control knob to the Off position. Depress the washer button. The washer pump should operate and the wipers should operate for as long as the washer button is depressed. The wipers should continue to operate for about three sweep cycles after the button is released before they park. If the wipers are OK, but the washers are not, go to Step 3. If the washers are OK, but the wipers are not, go to Step 5.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the headlamp and dash wire harness connector for the washer pump/motor from the motor connector receptacle. Measure the resistance between the ground circuit cavity of the headlamp and dash wire harness connector for the washer pump/motor and a good ground. The meter should read zero ohms. If OK, go to Step 4. If not OK, repair the open ground circuit to ground (G100) as required.

(4) Reconnect the battery negative cable. Turn the ignition switch to the On position. With the washer button depressed, check for battery voltage at the washer switch output circuit cavity of the headlamp and dash wire harness connector for the washer pump/motor. If OK, replace the faulty washer pump/motor. If not OK, repair the open washer switch output circuit between the washer pump/motor and the multi-function switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector (Connector C1) for the Central Timer Module

WIPERS/WASHERS (Continued)

(CTM) from the CTM connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. With the washer button depressed, check for battery voltage at the washer switch sense circuit cavity of the instrument panel wire harness connector (Connector C1) for the CTM. If OK, proceed to the diagnosis for the wiper relay. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER RELAY - DIAGNOSIS AND TESTING). If not OK, repair the open washer switch sense circuit between the CTM and the multi-function switch as required.

CLEANING - WIPER & WASHER SYSTEM**WIPER SYSTEM**

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

WASHER SYSTEM

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the front washer pump/motor from the reservoir. Clean foreign material from the inside of the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

INSPECTION - WIPER & WASHER SYSTEM**WIPER SYSTEM**

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

(1) Inspect the wiper arms for any indications of damage, or contamination. If the wiper arms are contaminated with any foreign material, clean them as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). If a wiper arm is damaged or corrosion is evident, replace the wiper arm with a new unit. Do not attempt to repair a wiper arm that is damaged or corroded.

(2) Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no side-to-side looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident side-to-side play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

(3) Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.

(4) Inspect the wiper blades and squeegees for any indications of damage, contamination, or rubber deterioration (Fig. 1). If the wiper blades or squeegees are contaminated with any foreign material, clean them and the glass as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). After cleaning the wiper blade and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade. Also, if a wiper blade is damaged or the squeegee rubber is damaged or deteriorated, replace

WIPERS/WASHERS (Continued)

the wiper blade with a new unit. Do not attempt to repair a wiper blade that is damaged.

809ac961

Fig. 1 Wiper Blade Inspection

- 2 - ROAD FILM OR FOREIGN MATERIAL DEPOSITS
- 3 - HARD, BRITTLE, OR CRACKED
- 4 - DEFORMED OR FATIGUED
- 5 - SPLIT
- 6 - DAMAGED SUPPORT COMPONENTS

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

(1) Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING).

(2) Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also,

sharp bends that might pinch the washer hose must be avoided.

WASHER FLUID LEVEL SWITCH

DESCRIPTION

The washer fluid level switch is a single pole, single throw reed-type switch mounted on the rear of the washer reservoir above the washer pump/motor, in the left front corner of the engine compartment. Only the molded plastic switch mounting flange and connector receptacle are visible when the switch is installed in the reservoir. A short nipple formation extends from the inner surface of the switch mounting flange, and a barb on the nipple near the switch mounting flange is press-fit into a rubber grommet seal installed in the mounting hole of the reservoir. A small plastic float pivots on the end of a bracket that extends from the switch nipple formation. Within the float is a small magnet, which actuates the reed switch. The washer fluid level switch cannot be adjusted or repaired. If faulty or damaged, the switch must be replaced.

OPERATION

The washer fluid level switch uses a pivoting, oblong float to monitor the level of the washer fluid in the washer reservoir. The float contains a small magnet. When the float pivots, the changing proximity of its magnetic field will cause the contacts of the small, stationary reed switch to open or close. When the fluid level in the washer reservoir is at or above the float level, the float moves to a vertical position and the switch contacts open. When the fluid level in the washer reservoir falls below the pivoting float, the float moves to a horizontal position and the switch contacts close. The switch contacts are connected in series between ground and the washer fluid switch sense input of the instrument cluster. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. The switch receives ground through another take out of the headlamp and dash wire harness with a single eyelet terminal connector that is secured under a nut to a ground stud located on the front extension of the left front wheel housing in the engine compartment. The washer fluid level switch can be diagnosed using conventional diagnostic tools and methods. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/WASHER FLUID INDICATOR - DIAGNOSIS AND TESTING).

WASHER FLUID LEVEL SWITCH (Continued)

REMOVAL

The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor unit and allow the washer fluid to drain into a clean container for reuse.

(3) Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle (Fig. 2).

Fig. 2 Washer Reservoir

- 1 - FAN SHROUD
- 2 - WASHER FLUID LEVEL SWITCH
- 3 - WASHER PUMP/MOTOR
- 4 - WASHER RESERVOIR

NOTE: The pivoting float of the washer fluid level switch must be in a horizontal position within the reservoir in order to be removed. With the reservoir empty and in an upright position, the pivoting float will orient itself to the horizontal position when the switch connector receptacle is pointed straight downwards.

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal on the rear of the reservoir. Care must be taken not to damage the reservoir.

(5) Remove the washer fluid level switch and float from the washer reservoir.

(6) Remove the rubber grommet seal from the washer fluid level switch mounting hole in the washer reservoir and discard.

INSTALLATION

(1) Install a new rubber grommet seal into the washer fluid level switch mounting hole in the front of the washer reservoir. Always use a new rubber grommet seal on the reservoir.

(2) Position the float of the washer fluid level switch through the rubber grommet seal in the washer reservoir (Fig. 2). The connector receptacle of the washer fluid level switch should be pointed downward.

(3) Press firmly and evenly on the washer fluid level switch using hand pressure until the barbed nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.

(4) Reconnect the headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle.

(5) Reconnect the washer hose to the barbed outlet nipple of the washer pump/motor unit.

(6) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(7) Reconnect the battery negative cable.

WASHER HOSES/TUBES

DESCRIPTION

The washer plumbing consists of a small diameter rubber hose that is routed from the barbed outlet nipple of the washer pump/motor on the washer reservoir through the engine compartment along the left inner fender shield to a molded plastic in-line fitting with barbed nipples near the dash panel. A second section of washer hose passes from the engine compartment into the cowl plenum area through a dedicated hole with a rubber grommet near the left end of the cowl plenum panel. Beneath the cowl plenum cover/grille panel, a molded plastic wye fitting with barbed nipples joins the engine compartment hose to the two washer nozzle hoses. The two washer hoses are routed through locating clips on the underside of the cowl plenum cover/grille panel to the two washer nozzles.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings cannot be repaired. If these fittings are faulty or damaged, they must be replaced.

OPERATION

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the washer system plumbing and fittings to the two washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must

WASHER HOSES/TUBES (Continued)

be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

WASHER NOZZLE

DESCRIPTION

The two washer nozzles have integral snap features that secure them in dedicated holes in the cowl plenum cover/grille panel located near the base of the windshield. The domed upper surface of the washer nozzle is visible on the top of the plenum cover/grille panel, and the nozzle orifice is oriented towards the windshield glass. The washer plumbing fittings for the washer nozzles are concealed beneath the cowl plenum cover/grille panel. These fluidic washer nozzles are constructed of molded plastic. The cowl plenum cover/grille panel must be removed from the vehicle to access the nozzles for service. The washer nozzles cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

OPERATION

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor through rubber hoses, which are attached to a barbed nipple on each washer nozzle below the cowl plenum cover/grille panel. The washer nozzles incorporate a fluidic design, which causes the nozzle to emit the pressurized washer fluid as an oscillating stream to more effectively cover a larger area of the glass area to be cleaned.

REMOVAL

(1) Remove the cowl plenum cover/grille panel from the cowl top. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(2) From the underside of the cowl plenum cover/grille panel, disconnect the washer hose from the nozzle fitting.

(3) From the underside of the cowl plenum cover/grille panel, compress the snap features of the washer nozzle and push the nozzle out through the top of the panel.

INSTALLATION

(1) From the top of the cowl plenum cover/grille panel, insert the barbed nipple of the washer nozzle through the nozzle mounting hole.

(2) With the orifice of the washer nozzle oriented toward the windshield, use hand pressure to push the nozzle into the mounting hole until the snap fea-

tures of the nozzle are fully engaged with the underside of the cowl plenum cover/grille panel.

(3) From the underside of the cowl plenum cover/grille panel, reconnect the washer hose to the washer nozzle fitting.

(4) Reinstall the cowl plenum cover/grille panel onto the cowl top. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

WASHER PUMP/MOTOR

DESCRIPTION

The washer pump/motor unit is located on the rear of the washer reservoir, near the bottom in the left front corner of the engine compartment. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump. A seal flange with a large barbed inlet nipple on the pump housing passes through a rubber grommet seal installed in the dedicated mounting hole near the bottom of the washer reservoir. A smaller barbed outlet nipple on the pump housing connects the unit to the washer hose. The washer pump/motor unit is retained on the reservoir by the interference fit between the barbed pump inlet nipple and the grommet seal, which is a light press fit. An integral electrical connector receptacle is located on the motor housing. The washer pump/motor unit cannot be repaired. If faulty or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

The washer pump/motor unit is connected to the vehicle electrical system through a single take out and two-cavity connector of the headlamp and dash wire harness. The washer pump/motor is grounded at all times through a take out of the headlamp and dash wire harness with a single eyelet terminal connector that is secured by a nut to a ground stud located on the forward extension of the left front fender wheel housing in the engine compartment. The washer pump/motor receives battery current on a fused ignition switch output (run-acc) circuit through the closed contacts of the momentary washer switch within the multi-function switch only when the washer button on the end of the switch control stalk is depressed towards the steering column. Washer fluid is gravity-fed from the washer reservoir to the inlet side of the washer pump. When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through the pump outlet nipple, the washer plumbing, and the washer nozzles onto the windshield glass.

WASHER PUMP/MOTOR (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the headlamp and dash wire harness connector for the washer pump/motor from the motor connector receptacle (Fig. 3).

J948K-18

Fig. 3 Washer Reservoir

- 1 - FAN SHROUD
- 2 - WASHER FLUID LEVEL SWITCH
- 3 - WASHER PUMP/MOTOR
- 4 - WASHER RESERVOIR

(3) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor and allow the washer fluid to drain into a clean container for reuse.

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed inlet nipple of the washer pump out of the rubber grommet seal in the reservoir. Care must be taken not to damage the reservoir.

(5) Remove the rubber grommet seal from the washer pump mounting hole in the washer reservoir and discard.

INSTALLATION

(1) Install a new rubber grommet seal into the washer pump mounting hole in the washer reservoir. Always use a new rubber grommet seal on the reservoir.

(2) Position the barbed inlet nipple of the washer pump to the rubber grommet seal in the reservoir.

(3) Press firmly and evenly on the washer pump until the barbed inlet nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.

(4) Reconnect the washer hose to the barbed outlet nipple of the washer pump.

(5) Reconnect the headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle (Fig. 3).

(6) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(7) Reconnect the battery negative cable.

WASHER RESERVOIR**DESCRIPTION**

The molded plastic washer fluid reservoir is secured with integral mounting tabs to keyed slots on the left side of the radiator fan shroud in the left front corner of the engine compartment. A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for "Windshield Washer" and the text "Washer Fluid Only" molded into it snaps over the open end of the filler neck. A bail strap that is integral to the cap secures the cap to the reservoir filler neck when it is removed for inspecting or adjusting the fluid level in the reservoir. There are separate, dedicated holes on the rear side of the reservoir provided for the mounting of the washer/pump motor unit and the washer fluid level switch.

The washer reservoir cannot be repaired and, if faulty or damaged, it must be replaced. The washer reservoir, the grommet seals for the washer pump/motor unit and the washer fluid level switch, and the filler cap are each available for service replacement.

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the washer system. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir. The washer/pump motor unit is located in a sump area near the bottom of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the washer system will no longer operate.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - DRAIN/ALL EXCEPT DIESEL ENGINE) or (Refer to 7 -

WASHER RESERVOIR (Continued)

COOLING - STANDARD PROCEDURE - DRAIN/ DIESEL ENGINE).

(3) Disconnect the upper radiator hose from the radiator.

(4) Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle.

(5) Disconnect the headlamp and dash wire harness connector for the washer pump/motor unit from the motor connector receptacle.

(6) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor and allow the washer fluid to drain into a clean container for reuse.

(7) While pulling the washer reservoir away from the fan shroud, lift the reservoir upwards far enough to disengage the reservoir mounting tabs from the keyed upper and lower mounting slots in the fan shroud (Fig. 4).

Fig. 4 Washer Reservoir

- 1 - FAN SHROUD
- 2 - WASHER FLUID LEVEL SWITCH
- 3 - WASHER PUMP
- 4 - WASHER RESERVOIR

(8) Remove the washer reservoir from the engine compartment.

INSTALLATION

(1) Position the washer reservoir into the engine compartment (Fig. 4).

(2) Align and insert the upper and lower washer reservoir mounting tabs into the keyed upper and lower mounting slots in the radiator fan shroud. When all the tabs are inserted, use hand pressure to push the reservoir downwards far enough to engage the mounting tabs in the keyways of the mounting slots.

(3) Reconnect the washer hose to the barbed outlet nipple of the washer pump.

(4) Reconnect the headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle.

(5) Reconnect the headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle.

(6) Reconnect the upper radiator hose to the radiator.

(7) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - REFILL/ ALL EXCEPT DIESEL ENGINE) or (Refer to 7 - COOLING - STANDARD PROCEDURE - REFILL/ DIESEL ENGINE).

(8) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(9) Reconnect the battery negative cable.

WIPER ARM

DESCRIPTION

The wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. The wiper arm has a die cast metal pivot end. On the underside of this pivot end is a socket formation with internal serrations and a small, movable, stamped steel latch plate that is secured loosely under a small strap that is staked to the pivot end. The wide end of a tapered, stamped steel channel hinges on and is secured with a hinge pin to the pivot end of the wiper arm. One end of a long, rigid, stamped steel strap, with a small hole near its pivot end, is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook. Concealed within the stamped steel channel, one end of a long spring is hooked through a hole in a small stamped steel strap on the hinge pin within the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

A wiper arm cannot be adjusted or repaired. If damaged or faulty, the entire wiper arm unit must be replaced.

WIPER ARM (Continued)

OPERATION

The wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The socket formation with internal serrations in the wiper arm pivot end interlocks with the serrations on the outer circumference of the wiper pivot driver, allowing positive engagement and finite adjustment of this connection. The latch plate on the underside of the wiper arm pivot end locks the wiper arm to the wiper pivot when in its installed position and, when in its unlocked position, also serves as a blocker to hold the spring-loaded wiper arm off of the glass to facilitate removal and installation. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REMOVAL

- (1) Unlatch and open the hood.
- (2) Lift the wiper arm far enough to raise the wiper blade off of the glass and permit the wiper arm latch plate to be pulled out to its holding position, then release the arm (Fig. 5). The wiper arm and blade will remain off the glass with the latch in this position.

J948K-21

Fig. 5 Wiper Arm Remove/Install

CAUTION: The use of a screwdriver or other prying tool to remove a wiper arm may distort it. This distortion could allow the arm to come off of the wiper pivot during wiper operation, regardless of how carefully it is reinstalled.

- (3) Using a slight rocking motion, remove the wiper arm pivot end from the wiper pivot.

INSTALLATION

NOTE: Be certain that the wiper motor is in the park position before attempting to install the wiper arms.

Turn the ignition switch to the On position and move the wiper control knob on the end of the multi-function switch control stalk to its Off position. If the wiper pivots move, wait until they stop moving, then turn the ignition switch back to the Off position. The wiper motor is now in its park position.

- (1) The wiper arms must be indexed to the wiper pivots with the wiper motor in the park position to be properly installed (Fig. 6). Position the wiper arm pivot ends onto the wiper pivots so that the lower edge of the wiper arm tip is on the upper edge of the lower windshield blackout area ± 22 millimeters (± 0.86 inches).

J948K-22

Fig. 6 Wiper Arm Installation

- (2) Once the wiper arm is indexed to the wiper pivot, lift the wiper arm away from the windshield slightly to relieve the spring tension on the latch plate, then push the latch plate into the locked position. Gently lower the wiper arm until the wiper blade rests on the glass.

- (3) Wet the windshield glass, then operate the wipers. Turn the wiper control knob on the end of the multi-function switch control stalk to the Off position, then check for the correct wiper arm position and adjust as required.

WIPER BLADE

DESCRIPTION

Each wiper blade is secured by an integral latching pivot block to the hook formation on the tip of the wiper arms, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

- **Superstructure** - The superstructure includes several stamped steel bridges and links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

WIPER BLADE (Continued)

- **Element** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.

- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

All Ram truck models have two 50 centimeter (19.69 inch) wiper blades with non-replaceable rubber elements (squeegees). These wiper blades also include an anti-lift feature. The wiper blades cannot be adjusted or repaired. If faulty, worn, or damaged the entire wiper blade unit must be replaced.

OPERATION

The wiper blade is moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface. The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

NOTE: The driver side and passenger side wiper blades are not interchangeable. The driver side wiper blade has an extra bridge and eight pairs of claws securing the wiper element. The passenger side wiper blade has six pairs of claws securing the wiper element. The notched retainer end of both wiper elements should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

- (1) Turn the wiper control knob on the end of the multi-function switch control stalk to the On position. Cycle the wiper blades to a convenient working location on the windshield by turning the ignition switch to the On and Off positions.

- (2) Lift the wiper arm to raise the wiper blade and element off of the glass.

- (3) To remove the wiper blade from the wiper arm, push the pivot block latch release tab under the tip of the arm and slide the blade away from the tip

towards the pivot end of the arm far enough to disengage the pivot block from the hook (Fig. 7).

Fig. 7 Wiper Blade Remove/Install - Typical

1 - RELEASE TAB

- (4) Extract the hook formation on the tip of the wiper arm from the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

- (5) Gently lower the wiper arm tip onto the glass.

INSTALLATION

NOTE: The driver side and passenger side wiper blades are not interchangeable. The driver side wiper blade has an extra bridge and eight pairs of claws securing the wiper element. The passenger side wiper blade has six pairs of claws securing the wiper element. The notched retainer end of both wiper elements should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

- (1) Lift the wiper arm off of the windshield glass.

- (2) Position the wiper blade near the hook formation on the tip of the arm with the notched retainer for the wiper element oriented towards the end of the wiper arm that is nearest to the wiper pivot.

- (3) Insert the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit far enough to engage the pivot block with the hook (Fig. 7).

- (4) Slide the wiper blade pivot block/latch up into the hook formation on the tip of the wiper arm until the latch release tab snaps into its locked position.

- (5) Gently lower the wiper blade onto the glass.

WIPER MODULE

DESCRIPTION

The wiper module is secured with screws to the cowl plenum panel and concealed within the cowl plenum area beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts that protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades are the only visible components of the wiper module. The wiper module consists of the following major components:

- **Bracket** - The wiper module bracket consists of a long tubular steel main member that has a stamped pivot bracket formation near each end where the two wiper pivots are secured. A stamped steel mounting plate for the wiper motor is secured with welds near the center of the main member.

- **Crank Arm** - The wiper motor crank arm is a stamped steel unit that has a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.

- **Linkage** - The two wiper linkage members are each constructed of stamped steel. A driver side drive link with a plastic socket-type bushing in the left end, and a plastic sleeve-type bushing in the right end. Socket bushing is snap-fit over the pivot ball stud on the left pivot, while the sleeve bushing is fit over the longer wiper motor crank arm pivot stud. The passenger side drive link has a plastic socket-type bushing on each end. One end of this drive link is snap-fit over the pivot ball stud on the right pivot, while the other end is snap-fit over the exposed end of the longer ball stud on the wiper motor crank arm.

- **Motor** - The wiper motor is secured with three screws to the motor mounting plate near the center of the wiper module bracket. The wiper motor output shaft passes through a hole in the module bracket, where a nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal Positive Temperature Coefficient (PTC) circuit breaker.

- **Pivots** - The two wiper pivots are secured to the ends of the wiper module bracket. The crank arms that extend from the bottom of the pivot shafts each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each has an externally serrated drum secured to it.

The wiper module cannot be adjusted or repaired. If any component of the module is faulty or damaged, the entire wiper module unit must be replaced.

OPERATION

The wiper module operation is controlled by the vehicle operator through battery current inputs received by the wiper motor from the multi-function switch on the steering column. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads. The wiper motor crank arm, the two wiper linkage members, and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.

- (2) Remove the wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

- (3) Remove the cowl plenum cover/grille panel from the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

- (4) Remove the four screws that secure the wiper module bracket to the cowl plenum panel and the dash panel (Fig. 8).

Fig. 8 Wiper Module Remove/Install

1 - WIPER MODULE MOUNTING SCREWS

- (5) Reach into the cowl plenum to move the wiper module far enough to access the wiper module electrical connections (Fig. 9).

WIPER MODULE (Continued)

Fig. 9 Wiper Module Electrical Connections

- 1 - GROUND CONNECTOR
2 - WIPER MOTOR CONNECTOR
3 - GROUND TERMINAL

(6) Disconnect the headlamp and dash wire harness connector for the wiper motor from the wiper motor pigtail wire connector.

(7) Disconnect the headlamp and dash wire harness ground connector from the wiper motor ground terminal.

(8) Remove the wiper module from the cowl plenum as a unit.

INSTALLATION

(1) Position the wiper module into the cowl plenum as a unit.

(2) Reconnect the headlamp and dash wire harness ground connector to the wiper motor ground terminal (Fig. 9).

(3) Reconnect the headlamp and dash wire harness connector for the wiper motor to the wiper motor pigtail wire connector.

(4) Reach into the cowl plenum to align the wiper module mounting bracket with the locations for the mounting screws (Fig. 8).

(5) Install and tighten the four screws that secure the wiper module bracket to the cowl plenum panel and the dash panel. Tighten the screws to 8 N·m (72 in. lbs.).

(6) Reinstall the cowl plenum cover/grille panel onto the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(7) Reinstall the wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

(8) Reconnect the battery negative cable.

WIPER RELAY

DESCRIPTION

The wiper relay (or intermittent wipe relay) is located in the Power Distribution Center (PDC) near the battery in the engine compartment. See the fuse and relay layout label affixed to the inside surface of the PDC cover for wiper relay identification and location. The wiper relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing. The relay is connected to all of the required inputs and outputs through its PDC receptacle by five male spade-type terminals that extend from the bottom of the relay base. The ISO designation for each terminal is molded into the base adjacent to the terminal. The ISO terminal designations are as follows:

- **30 (Common Feed)** - This terminal is connected to the movable contact point of the relay.
- **85 (Coil Ground)** - This terminal is connected to the ground feed side of the relay control coil.
- **86 (Coil Battery)** - This terminal is connected to the battery feed side of the relay control coil.
- **87 (Normally Open)** - This terminal is connected to the normally open fixed contact point of the relay.
- **87A (Normally Closed)** - This terminal is connected to the normally closed fixed contact point of the relay.

The wiper relay cannot be adjusted or repaired. If the relay is damaged or faulty, it must be replaced.

OPERATION

The wiper relay (or intermittent wipe relay) is an electromechanical switch that uses a low current input from the Central Timer Module (CTM) to control a high current output to the low speed brush of the wiper motor. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

WIPER MOTOR RELAY (Continued)

The wiper relay terminals are connected to the vehicle electrical system through a connector receptacle in the Power Distribution Center (PDC). The inputs and outputs of the wiper relay include:

- The common feed terminal (30) is connected to the wiper motor low speed brush through the wiper control circuitry of the multi-function switch on the steering column. When the wiper relay is de-energized, the common feed terminal is connected to the wiper park switch output through the wiper park switch sense circuit. The wiper park switch output may be battery current (wipers are not parked), or ground (wipers are parked). When the wiper relay is energized, the common feed terminal of the wiper is connected to battery current from a fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit.

- The coil ground terminal (85) is connected to the relay control output of the CTM through the wiper motor relay control circuit. The CTM controls the ground path for this circuit internally to energize or de-energize the wiper relay based upon its programming and inputs from the wiper and washer control circuitry of the multi-function switch and from the wiper motor park switch.

- The coil battery terminal (86) is connected to battery current from a fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit whenever the ignition switch is in the On or Accessory positions.

- The normally open terminal (87) is connected to battery current from a fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit whenever the wiper relay control coil is energized by the CTM. This circuit provides fused ignition switch output (run-acc) current to the wiper motor low speed brush only when the wiper relay control coil is energized.

- The normally closed terminal (87A) is connected to the output of the wiper motor park switch through the wiper motor park switch sense circuit. This circuit provides battery current (wipers are not parked) or ground (wipers are parked) to the wiper motor low speed brush whenever the wiper relay control coil is de-energized and the Off position of the wiper control of the multi-function switch is selected.

The wiper relay can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - WIPER RELAY

The wiper relay (or intermittent wiper relay) (Fig. 10) is located in the Power Distribution Center (PDC) near the battery on the left side of the engine compartment. See the fuse and relay layout label affixed to the inside surface of the PDC cover for wiper relay identification and location. Refer to the appropriate

wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Remove the wiper relay from the PDC. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER RELAY - REMOVAL).

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, test the relay input and output circuits. Refer to RELAY CIRCUIT TEST. If not OK, replace the faulty relay.

Fig. 10 Wiper Relay

- 30 - COMMON FEED
- 85 - COIL GROUND
- 86 - COIL BATTERY
- 87 - NORMALLY OPEN
- 87A - NORMALLY CLOSED

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to the multi-function switch. There should be continuity between the receptacle for terminal 30 of the wiper relay in the PDC and both driver low speed wiper motor driver circuit cavities of the instrument panel wire harness connector for the multi-function switch at all times. If OK, go to Step 2. If not OK, repair the open driver low speed wiper motor driver circuit(s) between the PDC and the multi-function switch as required.

(2) The relay normally closed terminal (87A) is connected to the wiper motor park switch through the wiper motor park switch sense circuit. There

WIPER MOTOR RELAY (Continued)

should be continuity between the receptacle for terminal 87A of the wiper relay in the PDC and the wiper motor park switch sense circuit cavity of the headlamp and dash wire harness connector for the wiper motor at all times. If OK, go to Step 3. If not OK, repair the open wiper motor park switch sense circuit between the PDC and the wiper motor as required.

(3) The relay normally open terminal (87) is connected to a fused ignition switch output (run-acc) fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit. There should be battery voltage at the receptacle for terminal 87 of the wiper relay in the PDC whenever the ignition switch is in the On or Accessory positions. If OK, go to Step 4. If not OK, repair the open fused ignition switch output (run-acc) circuit between the PDC and the JB as required.

(4) The coil battery terminal (86) is connected to a fused ignition switch output (run-acc) fuse in the JB through a fused ignition switch output (run-acc) circuit. There should be battery voltage at the receptacle for terminal 86 of the wiper relay in the PDC whenever the ignition switch is in the On or Accessory positions. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run-acc) circuit between the PDC and the JB as required.

(5) The coil ground terminal (85) is connected to the output of the Central Timer Module (CTM) through the wiper motor relay control circuit. There should be continuity between the receptacle for terminal 85 of the wiper relay in the PDC and the wiper motor relay control circuit cavity of the instrument panel wire harness connector (Connector C1) for the CTM at all times. If not OK, repair the open wiper motor relay control circuit between the PDC and the CTM as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 11).

Fig. 11 Power Distribution Center

1 - COVER

2 - POWER DISTRIBUTION CENTER

(3) See the fuse and relay layout label affixed to the underside of the PDC cover for wiper relay identification and location.

(4) Remove the wiper relay by grasping it firmly and pulling it straight out from the receptacle in the PDC.

INSTALLATION

(1) See the fuse and relay layout label affixed to the underside of the PDC cover for the proper wiper relay location (Fig. 11).

(2) Position the wiper relay in the proper receptacle in the PDC.

(3) Align the wiper relay terminals with the terminal cavities in the PDC receptacle.

(4) Push firmly and evenly on the top of the wiper relay until the terminals are fully seated in the terminal cavities in the PDC receptacle.

(5) Reinstall the cover onto the PDC.

WIRING DIAGRAM
INFORMATIONDESCRIPTION - HOW TO USE WIRING
DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

WIRING DIAGRAM INFORMATION (Continued)

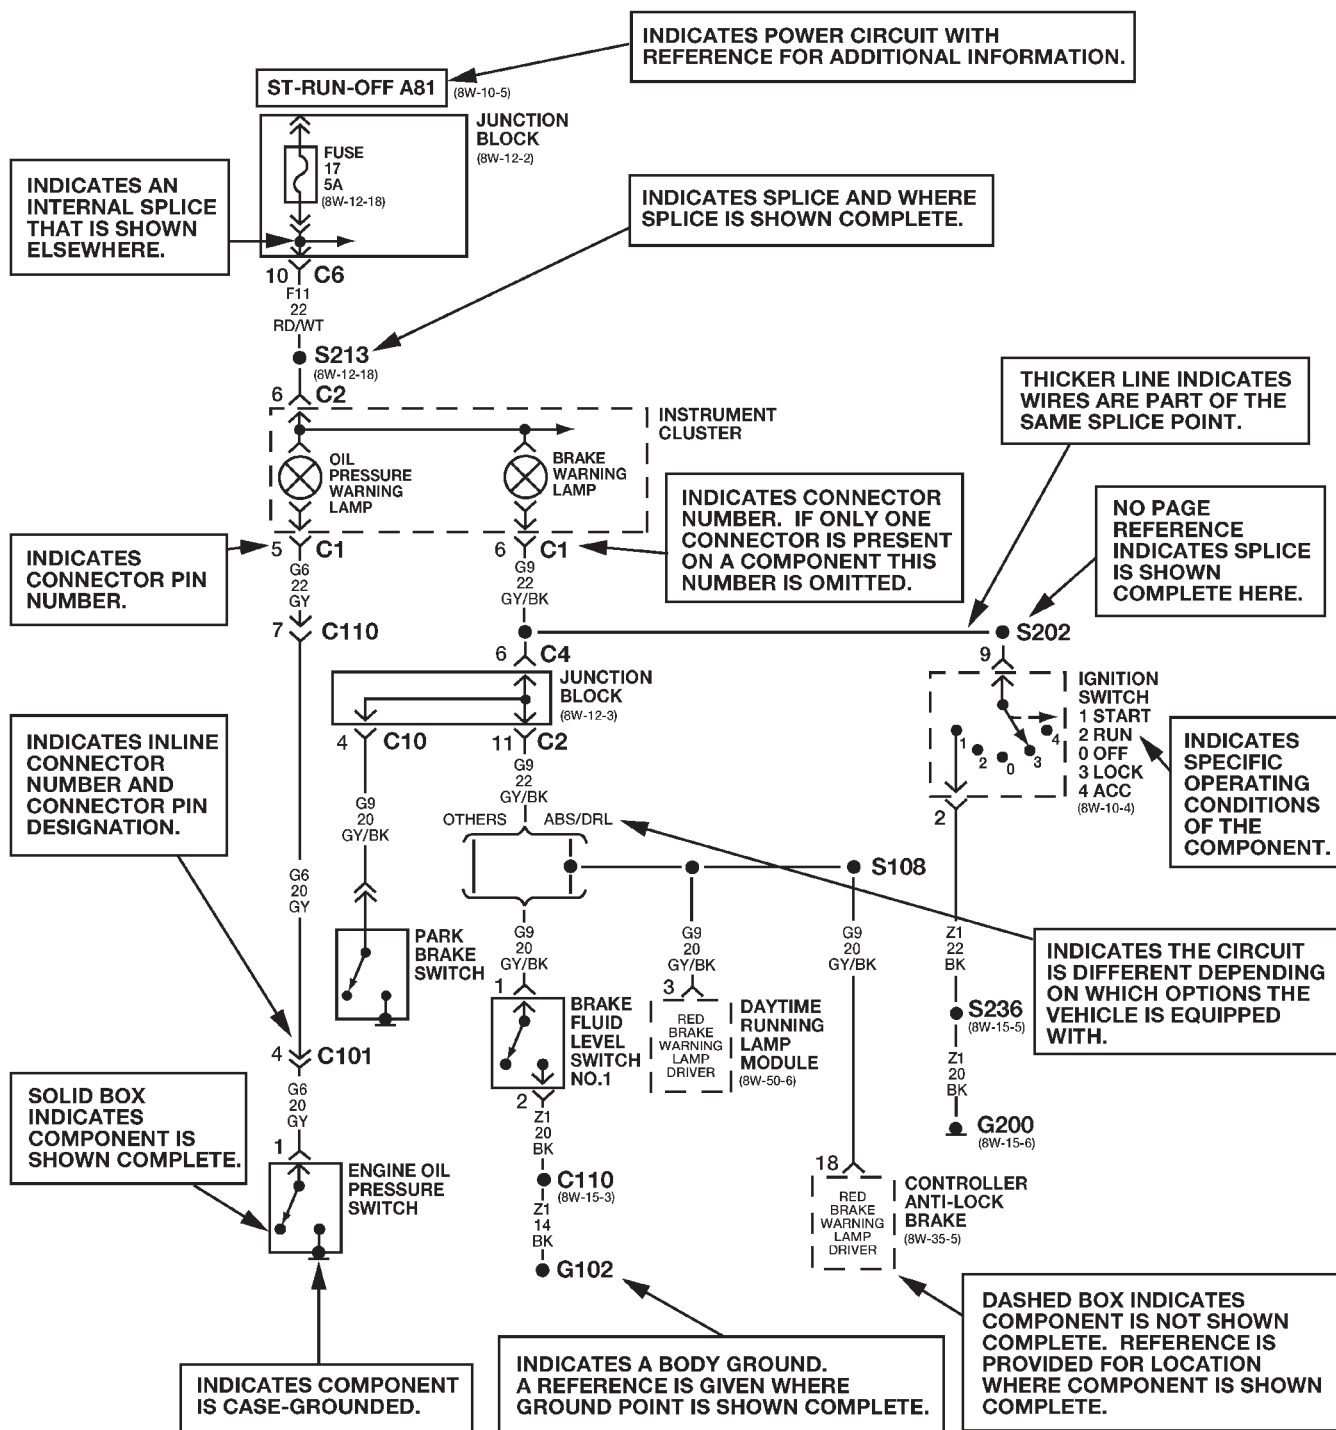

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP OF THE PAGE, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM OF THE PAGE.

The System shown here is an **EXAMPLE ONLY**. It does not represent the actual circuit shown in the **WIRING DIAGRAM SECTION**.

WARNINGS - GENERAL

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING:: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- **Jumper Wire** - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- **Voltmeter** - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

- **Probing Tools** - These tools are used for probing terminals in connectors (Fig. 4) Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

WIRING DIAGRAM INFORMATION (Continued)

**Fig. 4 PROBING TOOL**

948W-233

1 - SPECIAL TOOL 6801

2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
 - Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
 - Damaged connector/component casing exposing the item to dirt or moisture
 - Wire insulation that has rubbed through causing a short to ground
 - Some or all of the wiring strands broken inside of the insulation
 - Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

- (1) Verify the problem.
- (2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.
- (3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
- (4) Isolate the problem area.
- (5) Repair the problem area.
- (6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE - TESTING FOR VOLTAGE POTENTIAL

(1) Connect the ground lead of a voltmeter to a known good ground (Fig. 5).

(2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

948W-194

Fig. 5 TESTING FOR VOLTAGE POTENTIAL**STANDARD PROCEDURE - TESTING FOR CONTINUITY**

(1) Remove the fuse for the circuit being checked or, disconnect the battery.

(2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 6)

(3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

(1) Remove the fuse and disconnect all items involved with the fuse.

(2) Connect a test light or a voltmeter across the terminals of the fuse.

(3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.

(4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

WIRING DIAGRAM INFORMATION (Continued)

**Fig. 6 TESTING FOR CONTINUITY**

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

- (1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
- (2) Replace the blown fuse.
- (3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
- (4) Start connecting the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

- (1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 7).
- (2) Connect the other lead of the voltmeter to the other side of the switch or component.
- (3) Operate the item.
- (4) The voltmeter will show the difference in voltage between the two points.

**Fig. 7 TESTING FOR VOLTAGE DROP**

WIRING DIAGRAM INFORMATION (Continued)

SPECIAL TOOLS

SPECIAL TOOLS - WIRING/TERMINAL

PROBING TOOL PACKAGE 6807

TERMINAL PICK 6680

TERMINAL REMOVING TOOL 6932

TERMINAL REMOVING TOOL 6934

CONNECTOR - AUGAT

REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector from its mating half/component.
- (3) Push down on the yellow connector locking tab to release the terminals (Fig. 8).

958W-54

Fig. 8 AUGAT CONNECTOR REPAIR

- 1 - LOCKING TAB
2 - CONNECTOR

- (4) Using special tool 6932, push the terminal to remove it from the connector (Fig. 9).

803f5845

Fig. 9 USING

- 1 - SPECIAL TOOL 6932
2 - CONNECTOR

- (5) Repair or replace the terminal as necessary.

INSTALLATION

- (1) Reset the terminal locking tang.

CONNECTOR - AUGAT (Continued)

(2) Insert the removed wire in the same cavity on the repair connector.

(3) Repeat steps for each wire in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

(4) When the connector is re-assembled, the locking tab must be placed in the locked position to prevent terminal push out.

(5) Connect connector to its mating half/component.

(6) Connect battery and test all affected systems.

CONNECTOR - MOLEX

REMOVAL

(1) Disconnect battery.

(2) Disconnect the connector from its mating half/component.

(3) Insert special tool 6742 into the terminal end of the connector (Fig. 10).

948W-234

Fig. 10 MOLEX CONNECTOR REPAIR

1 - CONNECTOR

2 - SPECIAL TOOL 6742

(4) Using special tool 6742, release the locking fingers on the terminal (Fig. 11).

(5) Pull on the wire to remove it from the connector.

(6) Repair or replace the terminal as necessary.

INSTALLATION

(1) Reset the terminal locking tang.

(2) Insert the removed wire in the same cavity on the repair connector.

(3) Repeat steps for each wire in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

948W-235

Fig. 11 USING SPECIAL TOOL 6742

1 - CONNECTOR

2 - SPECIAL TOOL 6742

(4) Connect connector to its mating half/component.

(5) Connect battery and test all affected systems.

CONNECTOR - THOMAS AND BETTS

REMOVAL

(1) Disconnect battery.

(2) Disconnect the connector from its mating half/component.

(3) Push in the two lock tabs on the side of the connector (Fig. 12).

803f588a

Fig. 12 THOMAS AND BETTS CONNECTOR LOCK RELEASE TABS

1 - LOCK TABS

CONNECTOR - THOMAS AND BETTS (Continued)

(4) Insert the probe end of special tool 6934 into the back of the connector cavity (Fig. 13).

Fig. 13 REMOVING WIRE TERMINAL

1 - SPECIAL TOOL 6934

(5) Grasp the wire and tool 6934, then slowly remove the wire and terminal from the connector.

(6) Repair or replace the terminal as necessary.

INSTALLATION

(1) Reset the terminal locking tang.

(2) Insert the removed wire in the same cavity on the repair connector.

(3) Repeat steps for each wire in the connector, being sure that all wires are fully seated into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

(4) Push in the single lock tab on the side of the connector (Fig. 14).

(5) Connect connector to its mating half/component.

(6) Connect battery and test all affected systems.

DIODE

REMOVAL

(1) Disconnect the battery.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 15).

Fig. 14 SINGLE LOCK TAB

1 - SINGLE LOCK TAB

948W-197

Fig. 15 DIODE IDENTIFICATION

1 - CURRENT FLOW

2 - BAND AROUND DIODE INDICATES CURRENT FLOW

3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

(1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 15).

(3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.

(5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector being repaired from its mating half/component.
- (3) Remove the connector locking wedge, if required (Fig. 16).

Fig. 16 CONNECTOR LOCKING WEDGE TAB (TYPICAL)

- 1 - CONNECTOR
2 - CONNECTOR LOCKING WEDGE TAB

(4) Position the connector locking finger away from the terminal using the proper pick from special tool kit 6680. Pull on the wire to remove the terminal from the connector (Fig. 17) (Fig. 18).

Fig. 17 TERMINAL REMOVAL

- 1 - CONNECTOR
2 - FROM SPECIAL TOOL KIT 6680

Fig. 18 TERMINAL REMOVAL USING SPECIAL TOOL

- 1 - FROM SPECIAL TOOL KIT 6680
2 - CONNECTOR

(5) Cut the wire 6 inches from the back of the connector.

INSTALLATION

- (1) Select a wire from the terminal repair assembly that best matches the color wire being repaired.
- (2) Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
- (3) Splice the repair wire to the wire harness .
- (4) Insert the repaired wire into the connector.
- (5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
- (6) Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
- (7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 19).

Fig. 19 SPLICE CLIP

(4) Using crimping tool, Miller p/n 8272, crimp the splice clip and wires together (Fig. 20)

(5) Solder the connection together using rosin core type solder only (Fig. 21).

CAUTION: DO NOT USE ACID CORE SOLDER.

(6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 22).

1	L7 18BK/YL	HEADLAMP SWITCH OUTPUT
2	Z13 18BK	GROUND

RIGHT FRONT WHEEL SPEED SENSOR (ABS) - GRAY 2 WAY

CAV	CIRCUIT	FUNCTION
1	B6 20WT/DB	RIGHT FRONT WHEEL SPEED SENSOR (-)
2	B7 20WT	RIGHT FRONT WHEEL SPEED SENSOR (+)

RIGHT HEADLAMP - BLACK 3 WAY

CAV	CIRCUIT	FUNCTION
A	L45 18PK/RD	FUSED B(+)
B	-	-
C	L33 18LG/BR	HIGH BEAM HEADLAMP DRIVER

RIGHT LICENSE LAMP - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	L7 18BK/YL	PARK LAMP RELAY OUTPUT
2	Z13 18BK	GROUND

RIGHT OUTBOARD CLEARANCE LAMP - 2 WAY

CAV	CIRCUIT	FUNCTION
1	L7 18BK/YL	HEADLAMP SWITCH OUTPUT
2	Z4 18BK	GROUND

RIGHT OUTBOARD HEADLAMP - 3 WAY

CAV	CIRCUIT	FUNCTION
A	L4 16VT/WT (QUAD HEADLAMP)	DIMMER SWITCH LOW BEAM OUTPUT
A	L44 18VT/RD (EXCEPT QUAD HEAD-LAMP)	FUSED B(+)
B	L4 16VT/WT (EXCEPT QUAD HEAD-LAMP)	DIMMER SWITCH LOW BEAM OUTPUT
B	L44 18VT/RD (QUAD HEADLAMP)	FUSED B(+)
C	L3 16RD/OR	DIMMER SWITCH HIGH BEAM OUTPUT

RIGHT OUTBOARD IDENTIFICATION LAMP - 2 WAY

CAV	CIRCUIT	FUNCTION
1	L7 18BK/YL	HEADLAMP SWITCH OUTPUT
2	Z4 18BK	GROUND

RIGHT PARK/TURN SIGNAL LAMP - BLACK 3 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 18BK	GROUND
2	L7 18BK/YL	PARK LAMP RELAY OUTPUT
3	L60 18LG/TN	RIGHT TURN SIGNAL

RIGHT POWER MIRROR - 6 WAY		
CAV	CIRCUIT	FUNCTION
1	P72 20YL/BK	RIGHT MIRROR UP DRIVER
2	P74 20DB	RIGHT MIRROR LEFT DRIVER
3	P70 20WT	RIGHT MIRROR COMMON DRIVER (RIGHT/DOWN)
4	C16 20LB/YL	HEATED MIRROR
5	Z2 20BK/LG	GROUND
6	-	-

RIGHT REAR FENDER LAMP (DUAL REAR WHEELS) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	L7 18BK/YL	HEADLAMP SWITCH OUTPUT
2	Z13 18BK	GROUND

RIGHT REAR SPEAKER (2 DOOR PREMIUM) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	X92 18TN/BK	AMPLIFIED LOW RIGHT REAR SPEAKER (-)
2	X94 18TN/VT	AMPLIFIED LOW RIGHT REAR SPEAKER (+)

RIGHT REAR SPEAKER (4 DOOR PREMIUM) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	X57 18BR/LB	AMPLIFIED LOW RIGHT REAR SPEAKER (-)
2	X51 18BR/YL	AMPLIFIED LOW RIGHT REAR SPEAKER (+)

RIGHT REAR SPEAKER (STANDARD 2 DOOR) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
A	X58 18DB/OR	RIGHT REAR SPEAKER (-)
B	X52 18DB/WT	RIGHT REAR SPEAKER (+)

RIGHT REAR SPEAKER (STANDARD 4 DOOR) - 2 WAY		
CAV	CIRCUIT	FUNCTION
A	X57 18BR/LB	RIGHT REAR SPEAKER (-)
B	X51 18BR/YL	RIGHT REAR SPEAKER (+)

RIGHT REMOTE
RADIO SWITCH

RIGHT REMOTE RADIO SWITCH - 2 WAY

CAV	CIRCUIT	FUNCTION
1	Z2 22BK/LG	GROUND
2	X20 22RD/BK	RADIO CONTROL MUX

RIGHT SPEED
CONTROL SWITCH

RIGHT SPEED CONTROL SWITCH - 2 WAY

CAV	CIRCUIT	FUNCTION
1	K4 22WT	SENSOR GROUND
2	V37 22DG/RD	SPEED CONTROL SWITCH SIGNAL

RIGHT TAIL/
STOP/TURN
SIGNAL LAMP

RIGHT TAIL/STOP/TURN SIGNAL LAMP - BLACK 3 WAY

CAV	CIRCUIT	FUNCTION
1	Z13 18BK	GROUND
2	L7 18BK/YL	PARK LAMP RELAY OUTPUT
3	L62 18DG/BR	RIGHT TURN SIGNAL

RIGHT TWEETER
(PREMIUM)

RIGHT TWEETER (PREMIUM) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	X80 20LB/BK	AMPLIFIED HIGH RIGHT FRONT SPEAKER (-)
2	X82 20LB/RD	AMPLIFIED HIGH RIGHT FRONT SPEAKER (+)

RIGHT VISOR/VANITY
LAMP

RIGHT VISOR/VANITY LAMP - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
A	M1 20PK	FUSED B(+)
B	Z4 20BK	GROUND

SEAT
BELT SWITCH
(CLUB CAB)

SEAT BELT SWITCH (CLUB CAB) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	Z2 20BK/LG	GROUND
2	G10 22LG/RD (HEATED SEATS)	SEAT BELT SWITCH SENSE
2	G10 20LG/RD (MANUAL NON-HEATED SEATS)	SEAT BELT SWITCH SENSE

SEAT BELT SWITCH (STANDARD CAB) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	G10 20LG/RD	SEAT BELT SWITCH SENSE
2	Z2 20BK/LG	GROUND

SEAT HEAT INTERFACE MODULE - 14 WAY		
CAV	CIRCUIT	FUNCTION
1	P7 20LB/BK	DRIVER HEATED SEAT SWITCH
2	P144 20BK/WT	SEAT TEMPERATURE 5V SUPPLY
3	P130 16TN	RIGHT SEAT HEATER B(+) DRIVER
4	F235 16RD	B(+) TO HEATED SEAT MODULE
5	P131 16RD/DG	LEFT SEAT HEATER B(+) DRIVER
6	F235 16RD	B(+) TO HEATED SEAT MODULE
7	P142 22DB	RIGHT SEAT TEMPERATURE SENSOR INPUT
8	P141 20TN/LB	LEFT SEAT TEMPERATURE SENSOR INPUT
9	P8 20LB/WT	PASSENGER HEATED SEAT SWITCH
10	P138 20VT/LG	RIGHT SEAT LOW HEAT LED DRIVER
11	P140 20VT/BK	RIGHT SEAT HIGH HEAT LED DRIVER
12	P137 20DG	LEFT SEAT LOW HEAT LED DRIVER
13	Z2 18BK/LG	GROUND
14	P139 20WT	LEFT SEAT HIGH HEAT LED DRIVER

SPEED CONTROL SERVO - BLACK 4 WAY		
CAV	CIRCUIT	FUNCTION
1	V36 20TN/RD	SPEED CONTROL VACUUM SOLENOID CONTROL
2	V35 20LG/RD	SPEED CONTROL VENT SOLENOID CONTROL
3	V30 20DB/RD	SPEED CONTROL BRAKE SWITCH OUTPUT
4	Z1 20BK	GROUND

TAILGATE LAMP (DUAL REAR WHEELS) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	Z13 18BK	GROUND
2	L7 18BK/YL	HEADLAMP SWITCH OUTPUT

THROTTLE POSITION SENSOR (GAS) - 3 WAY		
CAV	CIRCUIT	FUNCTION
1	K6 20VT/WT	5V OUTPUT
2	K22 18OR/DB	THROTTLE POSITION SENSOR SIGNAL
3	K4 20BK/LB	SENSOR GROUND

TRAILER TOW
CONNECTOR

TRAILER TOW CONNECTOR - 10 WAY

CAV	CIRCUIT	FUNCTION
1	-	-
2	L62 16BR/RD	RIGHT TURN SIGNAL
3	L1 18VT/BK	BACK-UP LAMP FEED
4	A6 14RD/OR	FUSED B(+)
5	L76 14BK/OR	TRAILER TOW RELAY OUTPUT
6	-	-
7	B40 14LB	TRAILER TOW BRAKE B(+)
8	Z13 14BK	GROUND
9	Z13 14BK	GROUND
10	L63 16DG/RD	LEFT TURN SIGNAL

TRANSMISSION
SOLENOID ASSEMBLY

TRANSMISSION SOLENOID ASSEMBLY - 8 WAY

CAV	CIRCUIT	FUNCTION
1	T16 18RD	TRANSMISSION CONTROL RELAY OUTPUT
2	K7 18OR	5V SUPPLY
3	K4 18BK/LB	SENSOR GROUND
4	T25 18LG/WT	GOVERNOR PRESSURE SENSOR SIGNAL
5	K88 18VT/WT	GOVERNOR PRESSURE SOLENOID CONTROL
6	T60 18BR	3-4 SHIFT SOLENOID CONTROL
7	K54 18OR/BK	TORQUE CONVERTER CLUTCH SOLENOID CONTROL
8	T54 18VT	TRANSMISSION TEMPERATURE SENSOR SIGNAL

UNDERHOOD
LAMP

UNDERHOOD LAMP - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 20BK	GROUND
2	M1 20PK	FUSED B(+)

WASHER FLUID
LEVEL SWITCH

WASHER FLUID LEVEL SWITCH - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	G29 18BK/WT	WASHER FLUID SWITCH SENSE
2	Z1 18BK	GROUND

WATER IN FUEL
SENSOR
(DIESEL)

WIPER MOTOR

WATER IN FUEL SENSOR (DIESEL) - 2 WAY

CAV	CIRCUIT	FUNCTION
A	K104 18BK/LB	SENSOR GROUND
B	K1 18DG/RD	WATER IN FUEL SENSOR SIGNAL

WIPER MOTOR - 4 WAY

CAV	CIRCUIT	FUNCTION
1	V4 16RD/YL	WIPER SWITCH HIGH SPEED OUTPUT
2	V5 16DG	WIPER PARK SWITCH SENSE
3	V6 16DB	FUSED IGNITION SWITCH OUTPUT (RUN-ACC)
4	V3 16BR/WT	LOW SPEED WIPER SWITCH OUTPUT

CONNECTOR/GROUND LOCATIONS

DESCRIPTION 1

**CONNECTOR/GROUND
LOCATIONS****DESCRIPTION**

This section provides illustrations identifying connector and ground locations in the vehicle. A connector and ground index is provided. Use the wiring diagrams in each section for connector and ground identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

Connector Name/Number	Color	Location	Fig.
4WD Switch	BK	On Front Axle	N/S
A/C Compressor Clutch	BK	Rear of A/C Compressor	4,5,6,8
A/C Heater Control	BK	Center of Instrument Panel	25
A/C Heater Temperature Select	NAT	Center of Instrument Panel	25
A/C High Pressure Switch	BK	At A/C Compressor	4,5,6,8
A/C Low Pressure Switch	BK	Top of A/C Accumulator	1,2
Accelerator Pedal Position Sensor (Diesel)		Left Front of Engine	10,11
Aftermarket Trailer Tow Connector		Rear of Vehicle	N/S
Airbag Control Module		Center of I.P. at Airbag Control Module	23
Ambient Temperature Sensor	BK	Radiator Left Support	N/S
Ash Receiver Lamp		Center of Instrument Panel	26
Back-up Lamp Switch	BK	Top of Transmission	13
Battery Temperature Sensor	BK	Below Battery Tray	16
Blend Door Actuator		Center of Instrument Panel	N/S
Blower Motor	BK	Bottom Right of Instrument Panel	23
Blower Motor Resistor Block	BK	Bottom Right of Instrument Panel	26
Brake Lamp Switch		Brake Pedal Arm	23,24
Brake Pressure Switch		At Master Cylinder	14
Bypass Jumper	GN	Top Of Clutch Pedal	27
C105		Rear of Front Bumper	N/S
C106	BK	Rear of Front Bumper	17
C114	BK	Radiator Left Support	15
C125 (Diesel)	BK	Left Rear of Engine Compartment	2
C126 (Diesel)	GY	Left Rear of Engine Compartment	2
C129	BK	Above Left Front Body Cushion	15,22
C130		At Power Distribution Center	1,2
C134	BK	Left Cowl	23,25,27

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
C203		Left Cowl	23,25
C204		Left Cowl	25
C205		Instrument Panel Center Support	N/S
C206		Left Cowl	23,25
C237		Bottom Right of Instrument Panel	23,26
C303	BK	Below Driver's Seat	18
C308		Center Rear of Headliner	N/S
C329	BK	Below Right Tail Lamp	21
C333	BK	Below Left Tail Lamp	21
C342	BK	Left Rear of Frame	21
C343	BK	Left Rear of Frame	21
C345		Right Door	N/S
C346		Right Door	N/S
C347		Left Door	20
C348		Left Door	20
C352	BK	Left A-Pillar	20
C353	BK	Right A-Pillar	20
C358	NAT	Left Side Instrument Panel	20,23,27
C359		Heated Seat To Body Wiring	18
C360		Below Driver's Seat	18
C361		Left Rear Speaker Wiring	N/S
C364		Right Rear Speaker Wiring	N/S
C365		Under Passenger Power Seat	N/S
Camshaft Position Sensor (V6, V8)		Near of Distributor	3
Camshaft Position Sensor (V10)		Front of Engine	6
Camshaft Position Sensor (Diesel)		Left Front of Engine	10
Cargo Lamp No. 1	BK	Rear of Lamp	N/S
Cargo Lamp No. 2	BK	Rear of Lamp	N/S
Center High Mounted Stop Lamp No. 1	BK	Rear of Cab	18
Center High Mounted Stop Lamp No. 2	BK	Rear of Cab	18
Center Identification Lamp	BK	Behind Front of Headliner	20
Central Timer Module C1		Left Side Under Instrument Panel	23,24
Central Timer Module C2		Left Side Under Instrument Panel	23,24
Cigar Lighter	NAT	Center of Instrument Panel	25
Clockspring No.1		Steering Column	24
Clockspring No.2		Steering Column	24
Clockspring No.3		Steering Column	24
Clutch Pedal Position Switch	BK	Top of Clutch Pedal	27
Controller Anti-Lock Brake C1		Left Fender Side Shield	14
Controller Anti-Lock Brake C2		Left Fender Side Shield	14
Crankshaft Position Sensor (V6, V8)		Rear of Engine Block	3
Crankshaft Position Sensor (V10)		Right Side of Engine Block	6

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Cummins Bus (-)		Left Front of Engine	10
Cup Holder Lamp		Center of Instrument Panel	23, 26
Data Link Connector	BK	Left Bottom of Instrument Panel	23,24
Day/Night Mirror	BK	Day/Night Mirror	N/S
Daytime Running Lamp Module	BK	Left Fender Side Shield	14
Dome Lamp		Rear of Cab	18
Driver Airbag	BK	Steering Wheel	N/S
Driver Door Arm/Disarm Switch	BK	In Door	19
Driver Door Jamb Switch	NAT	Door Jamb	19
Driver Door Lock Motor	BK	In Door	19
Driver Door Window/Lock Switch	BL	In Door	19
Driver Heated Seat Module	BL	Under Seat	N/S
Driver Heated Seat Switch	RD	Center of Instrument Panel	N/S
Driver Lumbar Motor		Under Seat	N/S
Driver Power Seat Front Vertical Motor	BK	Under Seat	N/S
Driver Power Seat Horizontal Motor	BK	Under Seat	N/S
Driver Power Seat Rear Vertical Motor		Under Seat	N/S
Driver Power Seat Switch		At Seat	N/S
Driver Power Window Motor		In Door	19
Duty Cycle EVAP/Purge Solenoid	BK	Right Fender Side Shield	17
Electric Brake Provision		Bottom Left of Instrument Panel	N/S
Engine Control Module (Diesel)		Left Side Engine	12
Engine Coolant Temperature Sensor (Diesel)	BK	Left Front of Cylinder Head (Diesel)	10
Engine Coolant Temperature Sensor (Gas)	BK	On Thermostat Housing	3,6
Engine Oil Pressure Sensor (V6, V8)	BK	Near Distributor	3
Engine Oil Pressure Sensor (V10)		Near Oil Filter	6
Engine Oil Pressure Sensor (Diesel)		Left Side of Engine	12
Fuel Heater (Diesel)		Left Side of Engine	10
Fuel Injection Pump (Diesel)		Left Side of Engine, Below ECM	10
Fuel Injector No.1	BK	At Fuel Injector	4,5
Fuel Injector No. 2	BK	At Fuel Injector	4,5,6
Fuel Injector No. 3	BK	At Fuel Injector	4,5,6
Fuel Injector No. 4	BK	At Fuel Injector	4,5,6
Fuel Injector No. 5	BK	At Fuel Injector	4,5,6
Fuel Injector No. 6	BK	At Fuel Injector	4,5,6
Fuel Injector No. 7	BK	At Fuel Injector	4,6
Fuel Injector No. 8	BK	At Fuel Injector	4,6
Fuel Injector No. 9	BK	At Fuel Injector	6
Fuel Injector No. 10	BK	At Fuel Injector	6
Fuel Pump Module	LTGY	At Frame Rail	22
Fuel Transfer Pump (Diesel)		Left Rear of Engine Bottom of Pump	10

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
G100		Left Fender Side Shield	16
G101		Left Fender Side Shield	16
G102		Left Fender Side Shield (RWAL Ground)	N/S
G103		Near T/O for Wiper Motor	14
G105		Front of Engine (Engine Ground)	4,5,6,9
G107 (Diesel)		Left Rear of Engine	10
G113 (Diesel)		Primary Battery Engine Ground	N/S
G114		Battery Engine Ground	N/S
G115 (Diesel)		Primary Battery Body Ground	N/S
G116		Battery Frame Ground	N/S
G117 (Diesel)		Auxiliary Battery Engine Ground	N/S
G118 (Diesel)		Primary Frame Ground	N/S
G120 (Diesel)		Auxiliary Battery Body Ground	N/S
G200		Left Cowl	24
G201		Instrument Panel Right Center Support	23,25
G300		Left Lower Cowl	20
G301		Below Left Rear Speaker	18
G302		At Overhead Console	20
Generator	BK	Front of Engine	7,8
Glove Box Lamp		At Glove Box	23
Headlamp Switch C1	BK	Left Side of Instrument Panel	23,26
Headlamp Switch C2		Left Side of Instrument Panel	23,26
Heated Mirror Switch		Center of Instrument Panel	25
High Note Horn	BK	Front Bumper Right Support	17
Idle Air Control Motor	BK	On Throttle Body	9
Ignition Coil	GY	Right Front of Engine	4,5,9
Ignition Coil 4 Pack	BK	Right Side of Engine	9
Ignition Coil 6 Pack	BK	Right Side of Engine	9
Ignition Switch C1		Steering Column	24
Ignition Switch C2		Steering Column	24
Instrument Cluster C1		Rear of Instrument Cluster	23
Instrument Cluster C2		Rear of Instrument Cluster	23
Intake Air Heater Relay		Left Fender Side Shield	16
Intake Air Temperature Sensor (Diesel)		Left Rear of Engine	10
Intake Air Temperature Sensor (Gas)	GY	On Intake Manifold	4,5,6
Joint Connector No. 1		In Power Distribution Center	N/S
Joint Connector No. 2		In Power Distribution Center	N/S
Joint Connector No. 3		Front Bumper Right support	17
Joint Connector No. 4		Left Front Engine Compartment	16
Joint Connector No. 5	NAT	Left Side of Instrument Panel	24
Joint Connector No. 6	NAT	Left Side of Instrument Pane	24

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Joint Connector No. 7	NAT	Left Side of Instrument Pane	24
Joint Connector No. 8	NAT	Center of Instrument Panel	23
Junction Block C1	BL	Left Cowl	27
Junction Block C2	NAT	Left Cowl	27
Junction Block C3		Left Cowl	20
Junction Block C4	BR	Left Cowl	25
Junction Block C5	GN	Left Cowl	25
Junction Block C6	BK	Left Cowl	25
Junction Block C7	LTGY	Left Cowl	25
Junction Block C8	OR	Left Cowl	25
Junction Block C9	NAT	Left Cowl	25
Leak Detection Pump	BK	Right Fender Side Shield	17
Left Back-Up Lamp	GY	Rear of Lamp	N/S
Left Fog Lamp	BK	Rear of Fog Lamp	N/S
Left Front Door Speaker (Premium)	BK	In Door	19
Left Front Door Speaker (Standard)	BK	In Door	19
Left Front Fender Lamp		On Fender	21
Left Front Wheel Speed Sensor	BK	Left Fender Side Shield	14
Left Headlamp	BK	At Headlamp	N/S
Left License Lamp	BK	At Rear Bumper	21
Left Outboard Clearance Lamp	BK	Behind Front of Headliner	20
Left Outboard Headlamp	BL	At Headlamp	N/S
Left Outboard Identification Lamp	BK	Behind Front of Headliner	20
Left Park/Turn Signal Lamp	BK	At Lamp	N/S
Left Power Mirror	BK	In Door	19
Left Rear Fender Lamp	BK	On Fender	21
Left Rear Speaker (Premium)		At B Pillar	18
Left Rear Speaker (Standard)		At B Pillar	18
Left Rear Door Speaker		In Door	18
Left Remote Radio Switch		Steering Wheel	N/S
Left Speed Control Switch		Steering Wheel	N/S
Left Tail/Stop Turn Signal Lamp	BK	At Rear Bumper	21
Left Tweeter		Left A Pillar	N/S
Left Visor/Vanity Lamp	BK	Left A-Pillar	20
Low Note Horn	BK	Front Bumper Right Support	17
Manifold Absolute Pressure Sensor (V6, V8)	BK	On Throttle Body	4,5
Manifold Absolute Pressure Sensor (V10)	BK	Top of Intake Manifold	9
Manifold Air Pressure Sensor (Diesel)	BK	Rear of Intake Manifold	10
Multi-Function Switch		On Steering Column	24
Output Speed Sensor	BK	Left Side of Transmission	13
Overdrive Switch		On Shift Lever Arm	N/S
Overhead Console	BK	Front of Headliner	20

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Oxygen Sensor 1/1 Left Bank Up		Left Exhaust Manifold Downpipe	13
Oxygen Sensor 1/1 Upstream		Catalytic Converter Inlet Side	13
Oxygen Sensor 1/2 Downstream		Catalytic Converter Outlet Side	13
Oxygen Sensor 1/2 Left Bank Down		Catalytic Converter Outlet Side	13
Oxygen Sensor 1/2 Pre-catalyst		Catalytic Converter Inlet Side	13
Oxygen Sensor 1/3 Post Catalyst		Catalytic Converter Outlet Side	13
Oxygen Sensor 1/3 Post Catalyst		Post Catalyst	13
Oxygen Sensor 2/1 Right Bank Up		Right Exhaust Manifold Downpipe	13
Oxygen Sensor 2/2 Right Bank Down		Catalytic Converter Outlet Side	13
Park/Neutral Position Switch	BK	Left Side of Transmission	13
Passenger Airbag		At Glove Box	23,26
Passenger Airbag On/Off Switch C1		Lower Right Side of Instrument Panel	23
Passenger Airbag On/Off Switch C2		Lower Right Side of Instrument Panel	23
Passenger Door Arm/Disarm Switch	LTGY	In Door	19
Passenger Door Jamb Switch	NAT	In Door	19
Passenger Door Lock Motor	BK	In Door	19
Passenger Door Window/Lock Switch		In Door	19
Passenger Heated Seat Switch	BL	Center of Instrument Panel	N/S
Passenger Heated Seat Module		Under Seat	N/S
Passenger Lumbar Motor		Under Seat	N/S
Passenger Power Seat Front Vertical Motor		Under Seat	N/S
Passenger Power Seat Horizontal Motor		Under Seat	N/S
Passenger Power Seat Rear Vertical Motor		Under Seat	N/S
Passenger Power Seat Switch		At Seat	N/S
Passenger Power Window Motor		In Door	N/S
Power Seat Heater Control Module		Under Seat	N/S
Power Mirror Switch		Driver Door	19
Power Outlet	BK	Center of I.P.	25
Powertrain Control Module C1		Right Rear Engine Compartment	1,2
Powertrain Control Module C2		Right Rear Engine Compartment	1,2
Powertrain Control Module C3		Right Rear Engine Compartment	1,2
Radio Choke Relay	BK	Instrument Panel Center support	23,25
Radio C1	GY	Rear of Radio	25
Radio C2	BK	Rear of Radio	25
Radio C3	BK	Instrument Panel Center support	25
Rear Wheel Speed Sensor	BK	Left Frame Rail, Near Fuel Tank	21,22
Right Back-Up Lamp	BK	Rear of Lamp	N/S
Right Fog Lamp	BK	Rear of Fog Lamp	N/S
Right Front Door Speaker(Premium	BK	In Door	19
Right Front Door Speaker(Standard	BK	In Door	19
Right Front Fender Lamp		On Fender	21

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Right Front Wheel Speed Sensor	BK	Right Fender Side Shield	17
Right Headlamp	BL	At Headlamp	N/S
Right License Lamp	BK	At Rear Bumper	21
Right Outboard Clearance Lamp	BK	Behind Front of Headliner	20
Right Outboard Headlamp		At Headlamp	N/S
Right Outboard Identification Lamp	BK	Behind Front of Headliner	20
Right Park/Turn Signal Lamp	BK	At Lamp	N/S
Right Power Mirror	BK	In Door	19
Right Rear Fender Lamp		On Fender	21
Right Rear Speaker		Bottom of Right B Pillar	18
Right Remote Radio Switch		Steering Wheel	N/S
Right Speed Control Switch		Steering Wheel	N/S
Right Tail/Stop Turn Signal Lamp	BK	At Rear Bumper	21
Right Tweeter		Right A Pillar	N/S
Right Visor/Vanity Lamp	BK	Right A-Pillar	N/S
Seat Belt Switch		Above Left Rear Speaker	18
Tailgate Lamp		On Tailgate	21
Throttle Position Sensor		Throttle Body	4,5,9
Trailer Tow Connector	BK	On Trailer Hitch	21
Transmission Solenoid Assembly	BK	Side of Transmission	13
Under Hood Lamp	BK	Underside of Hood	15
Vehicle Speed Control Servo	BK	Below Battery	16
Washer Fluid Level Switch		At Reservoir	16
Water In Fuel Sensor	BK	Bottom of Fuel Filter/Water Separator	10
Windshield Washer Pump	BK	Bottom of Washer Fluid Reservoir	16
Wiper Motor	BK	Center Rear Engine Compartment	14

SPLICE LOCATIONS

DESCRIPTION 1

SPLICE LOCATIONS**DESCRIPTION**

This section provides illustrations identifying the general location of the splices in this vehicle. A splice

index is provided. Use the wiring diagrams in each section for splice number identification. Refer to the index for proper splice number. For splices that are not shown in the figures N/S appears in the Fig. column.

Splice Number	Location	Fig.
S100	Engine Harness Near T/O to Oil Pressure Sensor	3
S102	Headlamp and Dash Harness, Near T/O to Right Park/Turn Lamp	8
S103	Headlamp and Dash Harness, Near T/O to Left Park/Turn Lamp	N/S
S104	Headlamp and Dash Harness, Near T/O to Left Front Headlamp	N/S
S105	Headlamp and Dash Harness, In Power Distribution Center	7
S106	Headlamp and Dash Harness, In Power Distribution Center	7
S107	Headlamp and Dash Harness, Near Left Wheel Speed Sensor	7

POWER DISTRIBUTION

DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Junction Block (JB).

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Circuit splice blocks
- Flashers
- Relays.

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the

power distribution system components. Refer to the index in this service manual for the location of complete circuit diagrams for the various power distribution system components.

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate many accessories that the vehicle owner may choose to have installed in the aftermarket.

SPECIAL TOOLS

POWER DISTRIBUTION SYSTEMS

Terminal Pick Kit 6680

CIGAR LIGHTER OUTLET

DESCRIPTION

A cigar lighter is standard equipment on this model. The cigar lighter is installed in the instrument panel next to the ash receiver, which is located near the center of the instrument panel, below the radio. The cigar lighter base is secured by a snap fit within the instrument panel.

The cigar lighter knob and heating element unit, and the cigar lighter receptacle unit are available for service. These components cannot be repaired and, if faulty or damaged, they must be replaced.

OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or receptacle shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The cigar lighter receives battery voltage from a fuse in the junction block only when the ignition switch is in the Accessory or On positions.

The knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the receptacle shell, the heating element resistor coil is grounded through its housing to the receptacle shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the receptacle shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom

of the receptacle shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the receptacle shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

DIAGNOSIS & TESTING - CIGAR LIGHTER

For complete circuit diagrams, refer to **Cigar Lighter** in Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused ignition switch output (run/accessory) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/accessory) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused ignition switch output (run/accessory) circuit to the ignition switch as required.

(3) Turn the ignition switch to the Off position. Remove the cigar lighter knob and element from the cigar lighter receptacle. Check for continuity between the inside circumference of the cigar lighter receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Turn the ignition switch to the On position. Check for battery voltage at the insulated contact located at the back of the cigar lighter receptacle. If OK, replace the faulty cigar lighter knob and element. If not OK, go to Step 5.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the cigar lighter receptacle from the instrument panel and disconnect the wire harness connec-

CIGAR LIGHTER OUTLET (Continued)

tor. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/accessory) circuit cavity of the cigar lighter wire harness connector. If OK, replace the faulty cigar lighter receptacle. If not OK, repair the open fused ignition switch output (run/accessory) circuit to the junction block fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the cigar lighter knob and element out of the cigar lighter receptacle base, or unsnap the protective cap from the power outlet receptacle base (Fig. 1).

80b89821

Fig. 1 Cigar Lighter and Power Outlet

- 1 - RECEPTACLE BASE
- 2 - KNOB & ELEMENT
- 3 - MOUNT
- 4 - WIRE HARNESS CONNECTOR
- 5 - POWER OUTLET

(3) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the instrument panel (Fig. 2).

(4) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using

80a95367

Fig. 2 Cigar Lighter and Power Outlet Remove/Install

- 1 - KNOB AND ELEMENT
- 2 - RETAINING BOSSES-ENGAGE PLIERS HERE
- 3 - BASE
- 4 - PARTIALLY REMOVED
- 5 - EXTERNAL SNAP-RING PLIERS
- 6 - MOUNT
- 7 - BASE

a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

(6) Pull the receptacle base away from the instrument panel far enough to access the instrument panel wire harness connector.

(7) Disconnect the instrument panel wire harness connector from the cigar lighter or power outlet receptacle base connector receptacle.

(8) Remove the cigar lighter or power outlet mount from the instrument panel.

INSTALLATION

(1) Install the cigar lighter or power outlet mount into the instrument panel.

(2) Reconnect the instrument panel wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.

(3) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(4) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

CIGAR LIGHTER OUTLET (Continued)

(5) Install the cigar lighter knob and element into the cigar lighter receptacle base, or the protective cap into the power outlet receptacle base.

(6) Reconnect the battery negative cable.

CIRCUIT BREAKER

DESCRIPTION

An automatic resetting circuit breaker in the junction block is used to protect the system from a short circuit, or from an overload condition caused by an obstructed or stuck seat adjuster.

The circuit breaker cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS & TESTING - CIRCUIT BREAKER

For circuit descriptions and diagrams, refer to Wiring Diagrams.

(1) Locate the correct circuit breaker in the junction block. Pull out the circuit breaker slightly, but be certain that the circuit breaker terminals still contact the terminals in the junction block cavities.

(2) Connect the negative lead of a 12-volt DC voltmeter to a good ground.

(3) With the voltmeter positive lead, check both terminals of the circuit breaker for battery voltage.

If only one terminal has battery voltage, the circuit breaker is faulty and must be replaced. If neither terminal has battery voltage, repair the open circuit from the Power Distribution Center (PDC) as required.

GENERATOR CARTRIDGE FUSE

DESCRIPTION

A 140 ampere generator cartridge fuse is used on this model. The generator cartridge fuse is similar to other cartridge fuses found in the Power Distribution Center (PDC). This fuse has a color-coded plastic housing and a clear plastic fuse conductor inspection cover like other cartridge fuses, but has a higher current rating and is connected and secured with screws instead of being pushed onto male spade-type terminals. The generator cartridge fuse cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

The generator cartridge fuse is secured between the two B(+) terminal stud connection bus bars within the Power Distribution Center (PDC). This fuse protects the vehicle electrical system from damage that could be caused by excessive charging system output and/or excessive electrical system current

levels resulting from a faulty generator or faulty charging system control circuits. If the current rating of the fuse is exceeded, the fuse conductor melts to open the generator output circuit connection to the PDC. If a generator cartridge fuse fails, be certain to completely inspect and test the vehicle charging system before replacing the fuse and returning the vehicle to service. Refer to **Charging System** in the index of this service manual for the charging system diagnostic procedures. Refer to **Power Distribution** in the index of this service manual for the location of complete PDC circuit diagrams.

REMOVAL

If a generator cartridge fuse fails, be certain to inspect and test the vehicle charging system before replacing the cartridge fuse and returning the vehicle to service. Refer to **Charging System** in the index of this service manual for the charging system diagnostic procedures.

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and remove the cover from the Power Distribution Center (PDC).

(3) Remove the two screws that secure the generator cartridge fuse to the two B(+) terminal stud bus bars within the PDC.

(4) Remove the generator cartridge fuse from the PDC.

INSTALLATION

If a generator cartridge fuse fails, be certain to inspect and test the vehicle charging system before replacing the cartridge fuse and returning the vehicle to service. Refer to **Charging System** in the index of this service manual for the charging system diagnostic procedures.

(1) Position the generator cartridge fuse onto the two B(+) terminal stud bus bars within the PDC.

(2) Install and tighten the two screws that secure the generator cartridge fuse to the two B(+) terminal stud bus bars within the PDC. Tighten the screws to 3.4 N·m (30 in. lbs.). **Be certain that both screws are tightened to the proper torque value.**

(3) Install and latch the cover onto the PDC.

(4) Reconnect the battery negative cable.

IOD FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse (Fig. 3) that is disconnected within the Junction Block (JB) when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the JB as part of the preparation

IOD FUSE (Continued)

**Fig. 3 Ignition-Off Draw Fuse**

- 1 - JUNCTION BLOCK
 2 - IGNITION-OFF DRAW FUSE AND HOLDER
 3 - LEFT INSTRUMENT PANEL END BRACKET

procedures performed just prior to new vehicle delivery.

The left end of the instrument panel cover has a snap-fit fuse access panel that can be removed to provide service access to the fuses in the JB. A finger recess is molded into the access panel for easy removal. An adhesive-backed fuse layout map is secured to the instrument panel side of the access panel to ensure proper fuse identification. The IOD fuse is a 10 ampere mini blade-type fuse. The fuse is secured within a black molded plastic fuse holder and puller unit that serves both as a tool for disconnecting and reconnecting the fuse in its JB cavity, and as a fuse holder that conveniently stores the fuse in the same JB cavity after it has been disconnected.

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so

that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from JB fuse cavity 12 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Battery** in the index of this service manual for the location of additional service information covering the battery.

REMOVAL

The Ignition-Off Draw (IOD) fuse is disconnected from Junction Block (JB) fuse cavity 12 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

- (1) Turn the ignition switch to the Off position.
- (2) Remove the fuse access panel by unsnapping it from the left outboard end of the instrument panel.
- (3) Grasp the upper and lower tabs of the IOD fuse holder unit in fuse cavity 12 of the JB between the thumb and forefinger and pull the unit firmly outward.
- (4) Install the fuse access panel by snapping it onto the left outboard end of the instrument panel.

INSTALLATION

The Ignition-Off Draw (IOD) fuse is disconnected from Junction Block (JB) fuse cavity 12 (Fig. 4) when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

80bcea86

Fig. 4 Ignition-Off Draw Fuse

- 1 - JUNCTION BLOCK
- 2 - IGNITION-OFF DRAW FUSE AND HOLDER
- 3 - LEFT INSTRUMENT PANEL END BRACKET

- (1) Turn the ignition switch to the Off position.
- (2) To install the IOD fuse, use a thumb to press the IOD fuse holder unit in fuse cavity 12 firmly into the JB.
- (3) Install the fuse access panel by snapping it onto the left outboard end of the instrument panel.

JUNCTION BLOCK

DESCRIPTION

An electrical Junction Block (JB) is concealed behind the left outboard end of the instrument panel cover (Fig. 5). The JB combines the functions previously provided by a separate fuseblock module and relay center, serves to simplify and centralize numerous electrical components, and to distribute electrical current to many of the accessory systems in the vehicle. It also eliminates the need for numerous splice connections and serves in place of a bulkhead connector between many of the engine compartment, instrument panel, and body wire harnesses. The JB houses up to nineteen blade-type fuses (two standard-type and seventeen mini-type), up to two blade-type automatic resetting circuit breakers, the electronic combination turn signal and hazard warning flasher, and one International Standards Organization (ISO) micro-relay.

80b171c0

Fig. 5 Junction Block Location

- 1 - JUNCTION BLOCK
- 2 - FUSE ACCESS PANEL

The molded plastic JB housing has integral mounting brackets that are secured with two screws to the left instrument panel end bracket. The left end of the instrument panel cover has a snap-fit fuse access panel that can be removed for service of the JB. A fuse puller and spare fuse holders are located on the back of the fuse access cover, as well as an adhesive-backed fuse layout map to ensure proper fuse identification.

The JB unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the JB housing is faulty or damaged, the entire JB unit must be replaced.

OPERATION

All of the circuits entering and leaving the JB do so through up to nine wire harness connectors, which are connected to the JB through integral connector receptacles molded into the JB housing. Internal connection of all of the JB circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Junction Block** in the index of this service manual for the location of complete JB circuit diagrams.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.

JUNCTION BLOCK (Continued)

(2) Roll down the instrument panel from the dash panel, but do not remove it from the vehicle. Refer to **Instrument Panel Assembly** in the index of this service manual for the instrument panel assembly removal procedures.

(3) Reach through the outboard side of the instrument panel steering column opening to access and disconnect all of the wire harness connectors from the Junction Block (JB) connector receptacles (Fig. 6).

Fig. 6 Junction Block Remove/Install

- 1 - END BRACKET
- 2 - JUNCTION BLOCK
- 3 - SCREWS

(4) Reach through the outboard side of the instrument panel steering column opening to access and remove the two screws that secure the JB to the left instrument panel end bracket.

(5) Reach through the outboard side of the instrument panel steering column opening to remove the JB from the left instrument panel end bracket.

INSTALLATION

NOTE: If the Junction Block (JB) is being replaced with a new unit, be certain to transfer each of the fuses, circuit breakers and relays from the faulty JB to the proper cavities of the replacement JB. Refer to Junction Block in the index of this service manual for the location of complete circuit diagrams and cavity assignments for the JB.

(1) Reach through the outboard side of the instrument panel steering column opening to position the JB onto the left instrument panel end bracket.

(2) Reach through the outboard side of the instrument panel steering column opening to install and tighten the two screws that secure the JB to the left instrument panel end bracket. Tighten the screws to 2.85 N·m (25 in. lbs.).

(3) Reach through the outboard side of the instrument panel steering column opening to access and reconnect all of the wire harness connectors to the JB connector receptacles.

(4) Install the instrument panel onto the dash panel. Refer to **Instrument Panel Assembly** in the index of this service manual for the location of the instrument panel assembly installation procedures.

(5) Reconnect the battery negative cable.

POWER DISTRIBUTION CENTER

DESCRIPTION

80b9a53c

Fig. 7 Power Distribution Center Location

- 1 - POWER DISTRIBUTION CENTER

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC) (Fig. 7). The molded plastic PDC housing is located in the left front corner of the engine compartment, just behind the battery. The PDC houses the generator cartridge fuse and up to twelve maxi-type cartridge fuses,

POWER DISTRIBUTION CENTER (Continued)

which replace all in-line fusible links. The PDC also houses up to thirteen blade-type fuses (two standard-type and eleven mini-type), up to seventeen International Standards Organization (ISO) relays (five standard-type and twelve micro-type), two joint connectors (one eighteen-way and one twenty-eight-way), a forty-three-way engine wire harness in-line connector and a fuse puller.

The PDC housing is secured in the engine compartment on the outboard side with two screws to the left front inner fender shield, and with a screw on the inboard side to the left front inner wheel house. The PDC housing has a molded plastic cover that includes two integral latches, one on each side. The PDC cover is easily opened and removed for service access and has a convenient adhesive-backed fuse and relay layout map affixed to the inside surface of the cover to ensure proper component identification.

The PDC unit cannot be repaired and is only serviced as a unit with the headlamp and dash wire harness. If the internal circuits or the PDC housing are faulty or damaged, the headlamp and dash wire harness unit must be replaced.

OPERATION

All of the current from the battery and the generator output enters the PDC through two cables with eyelets that are secured with nuts to the two B(+) terminal studs located just inside the inboard end of the PDC housing. The PDC cover is unlatched and removed to access the battery and generator output connection B(+) terminal studs, the fuses, the relays, the joint connectors and the engine wire harness in-line connector. Internal connection of all of the PDC circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Power Distribution** in the index of this service manual for the location of complete PDC circuit diagrams.

REMOVAL

The Power Distribution Center (PDC) is serviced as a unit with the headlamp and dash wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and headlamp and dash wire harness unit must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect each of the headlamp and dash wire harness connectors. Refer to **Connector Locations** in the index of this service manual for the location of more information on the headlamp and dash wire harness connector locations.

(3) Remove all of the fasteners that secure each of the headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in the index of this service

manual for the location of more information on the ground eyelet locations.

(4) Disengage each of the retainers that secure the headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in the index of this service manual for the location of more information on the headlamp and dash wire harness retainer locations.

(5) Unlatch and remove the cover from the PDC.

(6) Remove the screw that secures the engine wire harness in-line connector to the PDC and disconnect the connector (Fig. 8).

80b9a53f

Fig. 8 Engine Wire Harness In-Line Connector

- 1 - LEFT FENDER
- 2 - POWER DISTRIBUTION CENTER
- 3 - ENGINE WIRE HARNESS IN-LINE CONNECTOR
- 4 - SCREW

(7) Remove the nut that secures the eyelet of the battery negative cable generator output take out to the rearward B(+) terminal stud in the PDC and remove the eyelet from the stud (Fig. 9).

(8) Remove the nut that secures the eyelet of the battery positive cable PDC take out to the forward B(+) terminal stud in the PDC and remove the eyelet from the stud.

(9) Remove the screw that secures the PDC housing to the left front fender wheel housing (Fig. 10).

(10) Remove the two screws that secure the PDC housing to the left front fender inner shield.

(11) Remove the PDC and the headlamp and dash wire harness from the engine compartment as a unit.

INSTALLATION

The Power Distribution Center (PDC) is serviced as a unit with the headlamp and dash wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and headlamp and dash wire harness unit must be replaced.

POWER DISTRIBUTION CENTER (Continued)

**Fig. 9 Battery and Generator Connections to PDC**

- 1 - NUTS
- 2 - BATTERY POSITIVE CABLE
- 3 - BATTERY NEGATIVE CABLE

- 5 - CABLE EYELETS

**Fig. 10 Power Distribution Center**

- 1 - FENDER INNER SHIELD
- 2 - INNER WHEEL HOUSE
- 3 - SCREW
- 4 - SCREW
- 5 - POWER DISTRIBUTION CENTER

NOTE: If the PDC is being replaced with a new unit, be certain to transfer each of the blade-type fuses, cartridge fuses and relays from the faulty PDC to the proper cavities of the replacement PDC. Refer to Power Distribution in the index of this service manual for the location of complete PDC circuit diagrams and cavity assignments.

(1) Position the PDC and the headlamp and dash wire harness unit in the engine compartment.

(2) Install and tighten the two screws that secure the PDC housing to the left front fender inner shield. Tighten the screws to 8.4 N·m (75 in. lbs.).

(3) Install and tighten the screw that secures the PDC housing to the left front fender wheel housing. Tighten the screw to 2.2 N·m (20 in. lbs.).

(4) Install the eyelet of the battery positive cable PDC take out onto the forward B(+) terminal stud in the PDC.

(5) Install and tighten the nut that secures the eyelet of the battery positive cable PDC take out to the forward B(+) terminal stud in the PDC. Tighten the nut to 8.4 N·m (75 in. lbs.).

(6) Install the eyelet of the battery negative cable generator output take out onto the rearward B(+) terminal stud in the PDC.

(7) Install and tighten the nut that secures the eyelet of the battery negative cable generator output take out to the rearward B(+) terminal stud in the PDC. Tighten the nut to 75 in. lbs.

(8) Reconnect the engine wire harness in-line connector to the PDC.

(9) Install and tighten the screw that secures the engine wire harness in-line connector to the PDC. Tighten the screw until a distinct audible click is heard.

(10) Install and latch the cover onto the PDC.

(11) Engage each of the retainers that secure the headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in the index of this service manual for the location of more information on the headlamp and dash wire harness retainer locations.

(12) Install all of the fasteners that secure each of the headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in the index of this service manual for the location of more information on the ground eyelet locations.

(13) Reconnect each of the headlamp and dash wire harness connectors. Refer to **Connector Locations** in the index of this service manual for the location of more information on the headlamp and dash wire harness connector locations.

(14) Reconnect the battery negative cable.

POWER OUTLET

DESCRIPTION

An accessory power outlet is standard equipment on this model. The power outlet is installed in the instrument panel below the cigar lighter and next to the ash receiver, which is located near the center of

POWER OUTLET (Continued)

the instrument panel, below the radio. The power outlet base is secured by a snap fit within the instrument panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Power Distribution Center (PDC) at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

DIAGNOSIS & TESTING - POWER OUTLET

For complete circuit diagrams, refer to **Power Outlet** in Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused B(+) fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the PDC. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.

(3) Remove the plastic protective cap from the power outlet receptacle. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the power outlet receptacle from the instrument panel. Disconnect the wire harness connector from the power outlet receptacle. Check for

continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the PDC fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the cigar lighter knob and element out of the cigar lighter receptacle base, or unsnap the protective cap from the power outlet receptacle base (Fig. 11).

80b89821

Fig. 11 Cigar Lighter and Power Outlet

- 1 - RECEPTACLE BASE
- 2 - KNOB & ELEMENT
- 3 - MOUNT
- 4 - WIRE HARNESS CONNECTOR
- 5 - POWER OUTLET

(3) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the instrument panel (Fig. 12).

(4) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

POWER OUTLET (Continued)

- 2 - RETAINING BOSSES-ENGAGE PLIERS HERE
- 3 - BASE
- 4 - PARTIALLY REMOVED
- 5 - EXTERNAL SNAP-RING PLIERS
- 6 - MOUNT
- 7 - BASE

(6) Pull the receptacle base away from the instrument panel far enough to access the instrument panel wire harness connector.

(7) Disconnect the instrument panel wire harness connector from the cigar lighter or power outlet receptacle base connector receptacle.

(8) Remove the cigar lighter or power outlet mount from the instrument panel.

INSTALLATION

(1) Install the cigar lighter or power outlet mount into the instrument panel.

(2) Reconnect the instrument panel wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.

(3) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(4) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(5) Install the cigar lighter knob and element into the cigar lighter receptacle base, or the protective cap into the power outlet receptacle base.

(6) Reconnect the battery negative cable.

ENGINE 3.9L (Continued)

ENGINE 3.9L

DESCRIPTION

The 3.9 Liter (238 CID) six-cylinder engine is a V-Type, lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed to use unleaded fuel.

The engine lubrication system consists of a rotor type oil pump and a full-flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5 on the left bank and 2, 4, 6 on the right bank. The firing order is 1-6-5-4-3-2 (Fig. 1).

The engine serial number is stamped into a machined pad located on the left front corner of the cylinder block. When component part replacement is necessary, use the engine type and serial number for reference (Fig. 2).

DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to 14 - FUEL SYSTEM for fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

Adjust oil level by draining or adding as needed 2. Change oil. (Refer to 9 - ENGINE/ LUBRICATION/OIL - STANDARD PROCEDURE) 3. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/ LUBRICATION - DIAGNOSIS AND TESTING) for engine oil pressure test/specifications 4. Clean/replace hydraulic tappets/lash adjusters 5. Install new push rods 6. Inspect oil supply to rocker arms and replace worn arms as needed 7. Install new hydraulic tappets/lash adjusters 8. Inspect all valve guides and replace as necessary 9. Grind valves and seats
CONNECTING ROD NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive connecting rod bearing clearance 5. Connecting rod journal out of round 6. Misaligned connecting rods 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/ LUBRICATION - DIAGNOSIS AND TESTING) engine oil pressure test/ specifications 3. Change oil to correct viscosity. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) for correct procedure/engine oil specifications Measure bearings for correct clearance with plasti-gage. Repair as necessary 5. Replace crankshaft or grind journals 6. Replace bent connecting rods
MAIN BEARING NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/ LUBRICATION - DIAGNOSIS AND TESTING) 3. Change oil to correct viscosity.

ENGINE 3.9L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Excessive main bearing clearance 5. Excessive end play 6. Crankshaft main journal out of round or worn 7. Loose flywheel or torque converter	4. Measure bearings for correct clearance. Repair as necessary 5. Check crankshaft thrust bearing for excessive wear on flanges 6. Grind journals or replace crankshaft 7. Inspect crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque
LOW OIL PRESSURE	1. Low oil level 2. Faulty oil pressure sending unit 3. Clogged oil filter 4. Worn oil pump 5. Thin or diluted oil 6. Excessive bearing clearance 7. Oil pump relief valve stuck 8. Oil pump suction tube loose, broken, bent or clogged 9. Oil pump cover warped or cracked	1. Check oil level and fill if necessary 2. Install new sending unit 3. Install new oil filter 4. Replace oil pump assembly. 5. Change oil to correct viscosity. 6. Measure bearings for correct clearance 7. Remove valve to inspect, clean and reinstall 8. Inspect suction tube and clean or replace if necessary 9. Install new oil pump
OIL LEAKS	1. Misaligned or deteriorated gaskets 2. Loose fastener, broken or porous metal part 3. Front or rear crankshaft oil seal leaking 4. Leaking oil gallery plug or cup plug	1. Replace gasket 2. Tighten, repair or replace the part 3. Replace seal 4. Remove and reseal threaded plug. Replace cup style plug
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. CCV System malfunction 2. Defective valve stem seal(s) 3. Worn or broken piston rings 4. Scuffed pistons/cylinder walls 5. Carbon in oil control ring groove 6. Worn valve guides 7. Piston rings fitted too tightly in grooves	1. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS - DESCRIPTION) for correct operation 2. Repair or replace seal(s) 3. Hone cylinder bores. Install new rings 4. Hone cylinder bores and replace pistons as required 5. Remove rings and de-carbon piston 6. Inspect/replace valve guides as necessary 7. Remove rings and check ring end gap and side clearance. Replace if necessary

ENGINE 3.9L (Continued)

DIAGNOSIS AND TESTING—LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none"> 1. Gaskets and O-Rings. <ol style="list-style-type: none"> (a) Misaligned or damaged. (b) Loose fasteners, broken or porous metal parts. 2. Crankshaft rear seal 3. Crankshaft seal flange. Scratched, nicked or grooved. 4. Oil pan flange cracked. 5. Timing chain cover seal, damaged or misaligned. 6. Scratched or damaged vibration damper hub. 	<ol style="list-style-type: none"> 1. <ol style="list-style-type: none"> (a) Replace as necessary. (b) Tighten fasteners, Repair or replace metal parts. 2. Replace as necessary. 3. Polish or replace crankshaft. 4. Replace oil pan. 5. Replace seal. 6. Polish or replace damper.
OIL PRESSURE DROP	<ol style="list-style-type: none"> 1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pump suction tube loose or damaged. 	<ol style="list-style-type: none"> 1. Check and correct oil level. 2. Replace sending unit. 3. Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Clean or replace relief valve. 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> 1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals. 	<ol style="list-style-type: none"> 1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

ENGINE 3.9L (Continued)

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING—CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART below

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE 3.9L (Continued)

DIAGNOSIS AND TESTING—REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.

- (4) If no leaks are detected, pressurized the crankcase as outlined in (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

CAUTION: Do not exceed 20.6 kPa (3 psi).

- (5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

- (6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. Refer to the service Diagnosis—Mechanical, under the Oil Leak row, for components inspections on possible causes and corrections.

- (7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL), for proper replacement procedures.

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

- (1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

- (2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

- (3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 3).

J9209-12

Fig. 3 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
- 2 - INTERSECT ANGLE

ENGINE 3.9L (Continued)

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic

ENGINE 3.9L (Continued)

material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the upper crossmember and top core support.
- (4) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

(5) Discharge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove the A/C compressor with the lines attached. Set aside.

(8) If equipped, remove the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

(9) Remove the washer bottle.

(10) Remove the fan and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(11) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(12) Remove the generator with the wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(13) Remove the air cleaner box.

(14) Disconnect the throttle linkage.

(15) Remove throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(16) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(17) Remove the distributor cap and wiring.

(18) Disconnect the heater hoses.

(19) Disconnect the power steering hoses, if equipped.

(20) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(21) On Manual Transmission vehicles, remove the shift lever.

(22) Raise and support the vehicle on a hoist.

(23) Remove the drain plug and drain the engine oil.

(24) Remove engine front mount through-bolt nuts.

(25) **Automatic Transmission** Remove the transmission cooler line brackets from oil pan.

(26) Disconnect exhaust pipe at manifold.

(27) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(28) **Manual Transmission** Remove the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).

(29) Lower the vehicle.

CAUTION: DO NOT lift the engine by the intake manifold.

(30) Install an engine lifting fixture.

ENGINE 3.9L (Continued)

(31) Remove engine from vehicle and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the through-bolt into the support cushion brackets.

(2) Install an engine support fixture.

(3) Raise and support the vehicle on a hoist.

(4) **Manual Transmission** Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION).

(5) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(6) Install exhaust pipe to manifold.

(7) **Automatic Transmission** Install the transmission cooler line brackets on oil pan.

(8) Install engine front mount through-bolt nuts. Tighten the nuts.

(9) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(10) Lower the vehicle.

(11) Remove engine-lifting fixture.

(12) On Manual Transmission vehicles, install the shift lever.

(13) Connect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(14) Connect the power steering hoses, if equipped.

(15) Connect the heater hoses.

(16) Install the distributor cap and wiring.

(17) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(18) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(19) Connect the throttle linkage.

(20) Install the air cleaner box.

(21) Install the generator and wire connections (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(22) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(23) Install the fan and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(24) Install the washer bottle.

(25) If equipped, install the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(26) Install the A/C compressor with the lines attached.

(27) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(28) Evacuate and charge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(29) Install the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(30) Install the upper crossmember and top core support.

(31) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(32) Connect the negative cable to the battery.

(33) Start engine and check for leaks.

AIR CLEANER ELEMENT

REMOVAL - 3.9L/5.2L/5.9L

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to 0, Lubrication and Maintenance.

CAUTION: Do not attempt to remove air cleaner element (filter) from housing by removing top cover only. To prevent damage to air cleaner housing, the entire air cleaner housing assembly must be removed from engine for air cleaner element replacement.

(1) Remove air inlet tube (Fig. 4) at side of air cleaner housing.

- 6 - RUBBER GROMMET
- 7 - SPRING CLIPS

(2) A band-type screw clamp secures the air cleaner housing to throttle body. Loosen, but do not remove, this screw clamp (Fig. 4). Note clamp positioning tabs on air cleaner housing.

(3) All Engines: Disconnect breather hose at rear of air cleaner housing.

(4) 5.9L V-8 HDC Engine Only: Disconnect air pump hose at air cleaner housing.

(5) The bottom/front of air cleaner housing is equipped with a rubber grommet (Fig. 4). A mounting stud is attached to intake manifold (Fig. 4) and is used to position air cleaner housing into this grommet. Lift assembly from throttle body while slipping assembly from mounting stud (Fig. 4).

(6) Check condition of gasket at throttle body and replace as necessary.

(7) The housing cover is equipped with three (3) spring clips (Fig. 4) and is hinged at rear with plastic tabs. Unlatch clips from top of air cleaner housing and tilt housing cover up and rearward for cover removal.

(8) Remove air cleaner element from air cleaner housing.

(9) Before installing new air cleaner element, clean inside of air cleaner housing.

INSTALLATION - 3.9L/5.2L/5.9L

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to Group 0, Lubrication and Maintenance.

(1) Position air cleaner cover to tabs on rear of air cleaner housing. Latch three spring clips to seal cover to housing.

(2) Position air cleaner housing assembly to throttle body while guiding rubber grommet over mounting stud. The lower part of screw clamp should be below top lip of throttle body.

(3) Push down on air cleaner housing at rubber grommet to seat housing at intake manifold.

(4) Tighten throttle body-to-air cleaner housing clamp to 4 N·m (35 in. lbs.) torque.

(5) Install air inlet tube at air cleaner housing inlet.

(6) Install breather hose.

(7) Install secondary air hose (if equipped).

CYLINDER HEAD

DESCRIPTION—CYLINDER HEAD

The cast iron cylinder heads (Fig. 5) are mounted to the cylinder block using eight bolts. The spark plugs are located in the peak of the wedge between the valves.

Fig. 5 Cylinder Head Assembly—3.9L Engine

- 1 - SPARK PLUGS
- 2 - SPARK PLUG
- 3 - INTAKE VALVE
- 4 - EXHAUST VALVES
- 5 - INTAKE VALVES
- 6 - EXHAUST VALVE

DESCRIPTION—CYLINDER HEAD COVER GASKET

The cylinder head cover gasket (Fig. 6) is a steel-backed silicone gasket, designed for long life usage.

Fig. 6 Cylinder Head Cover Gasket

- 1 - CYLINDER HEAD COVER GASKET

OPERATION—CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

OPERATION—CYLINDER HEAD COVER GASKET

The steel-backed silicone gasket is designed to seal the cylinder head cover for long periods of time through extensive heat and cold, without failure. The gasket is designed to be reusable.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

• Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

CYLINDER HEAD (Continued)

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

The alloy cast iron cylinder heads (Fig. 7) are held in place by eight bolts. The spark plugs are located at the peak of the wedge between the valves.

(1) Disconnect the battery negative cable from the battery.

(2) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove the intake manifold-to-generator bracket support rod. Remove the generator.

(4) Remove closed crankcase ventilation system.

(5) Disconnect the evaporation control system.

(6) Remove the air cleaner, air in-let hose and resonator.

(7) Perform fuel system pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(8) Disconnect the fuel supply line from the fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(9) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(10) Remove distributor cap and wires.

(11) Disconnect the coil wires.

(12) Disconnect coolant temperature sending unit wire.

(13) Disconnect heater hoses and bypass hose.

(14) Disconnect the vacuum supply hoses from the intake manifold.

(15) Disconnect the fuel injector harness and secure out of the way.

(16) Remove cylinder head covers and gaskets (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(17) Remove intake manifold and throttle body as an assembly. Discard the flange side gaskets and the front and rear cross-over gaskets.

(18) Remove exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).

(19) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.

(20) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(21) Remove spark plugs.

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. If out-of-flatness exceeds 0.00075mm (0.0001in.) times the span length in any direction, either replace head or lightly machine the head surface.

FOR EXAMPLE:—A 305 mm (12 in.) span is 0.102 mm (0.004 in.) out-of-flat. The allowable out-of-flat is 305×0.00075 (12 x 0.00075) equals 0.23 mm (0.009 in.). This amount of out-of-flat is acceptable.

The cylinder head surface finish should be 1.78-3.00 microns (70-125 microinches).

Inspect push rods. Replace worn or bent rods.

INSTALLATION

The alloy cast iron cylinder heads (Fig. 7) are held in place by eight bolts. The spark plugs are located at the peak of the wedge between the valves.

(1) Position the new cylinder head gaskets onto the cylinder block.

(2) Position the cylinder heads onto head gaskets and cylinder block.

(3) Starting at top center, tighten all cylinder head bolts, in sequence, to 68 N·m (50 ft. lbs.) torque (Fig. 7). Repeat procedure, tighten all cylinder head bolts to 143 N·m (105 ft. lbs.) torque. Repeat procedure to confirm that all bolts are at 143 N·m (105 ft. lbs.) torque.

CAUTION: When tightening the rocker arm bolts, be sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

(4) Install push rods and rocker arm assemblies in their original positions. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

CYLINDER HEAD (Continued)

**Fig. 7 Cylinder Head Bolt -Tightening Sequence**

(5) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION) and throttle body assembly.

(6) Install exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).

(7) Adjust spark plugs to specifications. Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(8) Install coil wires.

(9) Connect coolant temperature sending unit wire.

(10) Connect the fuel injector harness.

(11) Connect the vacuum supply hoses to the intake manifold.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Connect the accelerator linkage and, if so equipped, the speed control and transmission kick-down cables.

(15) Install the fuel supply line.

(16) Install the generator and accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque.

(17) Install the intake manifold-to-generator bracket support rod. Tighten the bolts.

(18) Install cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(19) Install closed crankcase ventilation system.

(20) Connect the evaporation control system.

(21) Install the resonator assembly, air in-let hose and air cleaner.

(22) Install the heat shields. Tighten the bolts to 41 N·m (30 ft. lbs.) torque.

(23) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(24) Connect the battery negative cable.

CYLINDER HEAD COVER(S)

REMOVAL

A steel-backed silicone gasket is used with the cylinder head cover (Fig. 8). This gasket can be used again.

J9209-104

Fig. 8 Cylinder Head Cover Gasket

1 - CYLINDER HEAD COVER GASKET

(1) Disconnect the negative cable from the battery.

(2) Disconnect closed ventilation system and evaporation control system from cylinder head cover.

(3) Remove cylinder head cover bolts, cover and gasket. The gasket may be used again.

CLEANING

Clean cylinder head cover gasket surface.

Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.

Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

A steel-backed silicone gasket is used with the cylinder head cover (Fig. 8). This gasket can be used again.

(1) Position the cylinder head cover gasket onto the head rail.

(2) Position the cylinder head cover onto the gasket and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(3) Install closed crankcase ventilation system and evaporation control system.

(4) Connect the negative cable to the battery.

(5) Start engine and check for leaks.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

Both the intake and exhaust valves are made of steel. The intake valve is 48.768 mm (1.92 inches) in diameter and the exhaust valve is 41.148 mm (1.62 inches) in diameter and has a 2.032 mm (0.080 inch) wafer interia welded to the tip for durability. These valves are not splayed.

STANDARD PROCEDURE—VALVES, GUIDES AND SPRINGS

VALVE CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

VALVE GUIDES

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 9). The special sleeve places the valve at the correct height for checking with a dial indicator.

Fig. 9 Positioning Valve with Tool C-3973

- 1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 10).

Fig. 10 Measuring Valve Guide Wear

- 1 - VALVE
2 - SPECIAL TOOL C-3339

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

VALVE GUIDES

Service valves with oversize stems are available. Refer to REAMER SIZES CHART

REAMER SIZES CHART

REAMER O/S	VALVE GUIDE SIZE
0.076 mm (0.003 in.)	8.026 - 8.052 mm (0.316 - 0.317 in.)
0.381 mm (0.015 in.)	8.331 - 8.357 mm (0.328 - 0.329 in.)

(1) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 in.). Use a two step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

INTAKE/EXHAUST VALVES & SEATS (Continued)

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a $43\frac{1}{4}^{\circ}$ to $43\frac{3}{4}^{\circ}$ face angle and a $44\frac{1}{4}^{\circ}$ to $44\frac{3}{4}^{\circ}$ seat angle (Fig. 11).

80ba7a5f

Fig. 11 Valve Face and Seat Angles

1 - CONTACT POINT

A,B,C and D Refer to VALVE FACE AND VALVE SEAT ANGLE CHART

VALVE FACE AND VALVE SEAT ANGLE CHART

ITEM	DESCRIPTION	SPECIFICATION
A	SEAT WIDTH INTAKE	1.016 - 1.524 mm (0.040 - 0.060 in.)
	EXHAUST	1.524 - 2.032 mm (0.060 - 0.080 in.)
B	FACE ANGLE (INT. AND EXT.)	$43\frac{1}{4}^{\circ}$ - $43\frac{3}{4}^{\circ}$
C	SEAT ANGLE (INT. AND EXT.)	$44\frac{1}{4}^{\circ}$ - $44\frac{3}{4}^{\circ}$
D	CONTACT SURFACE	—

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 12). Valves with less than 1.190 mm (0.047 in.) margin should be discarded.

J9209-127

Fig. 12 Intake and Exhaust Valves

1 - MARGIN

2 - VALVE SPRING RETAINER LOCK GROOVE

3 - STEM

4 - FACE

VALVE SEATS

CAUTION: DO NOT un-shroud valves during valve seat refacing (Fig. 13).

Fig. 13 Refacing Valve Seats

1 - STONE

2 - PILOT

3 - VALVE SEAT

4 - SHROUD

INTAKE/EXHAUST VALVES & SEATS (Continued)

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 in.) total indicator reading.

(3) Inspect the valve seat with Prussian blue, to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of intake seats should be 1.016-1.524 mm (0.040-0.060 in.). The width of the exhaust seats should be 1.524-2.032 mm (0.060-0.080 in.).

9509-79

Fig. 14 Testing Valve Spring for Compressed Length

- 1 - TORQUE WRENCH
2 - VALVE SPRING TESTER

VALVE SPRINGS

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 in.. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 in. mark on the threaded stud. Be sure the zero mark is to the front (Fig. 14). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

REMOVAL

(1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Compress valve springs using Valve Spring Compressor Tool MD- 998772A and adapter 6716A.

(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 15). The special sleeve places the valve at the correct height for checking with a dial indicator.

J9509-49

Fig. 15 Positioning Valve with Tool C-3973

- 1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 16).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 16 Measuring Valve Guide Wear**

- 1 - VALVE
2 - SPECIAL TOOL C-3339

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Coat valve stems with lubrication oil and insert them in cylinder head.

(5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.

(6) Install new seals on all valve guides. Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. This should bring spring height back to normal 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

(8) Install cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - INSTALLATION).

ENGINE BLOCK**CLEANING**

Clean cylinder block thoroughly and check all core hole plugs for evidence of leakage.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper. Refer to Honing Cylinder Bores in the Service Procedures portion of this Section.

Inspect the oil line plug, the oil line plug is located in the vertical passage at the rear of the block between the oil-to-filter and oil-from-filter passages (Fig. 17). Improper installation or missing plug could cause erratic, low, or no oil pressure.

The oil plug must come out the bottom. Use flat dowel, down the oil pressure sending unit hole from the top, to remove oil plug.

(1) Remove oil pressure sending unit from back of block.

(2) Insert a 3.175 mm (1/8 in.) finish wire, or equivalent, into passage.

(3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 in.) from machined surface of block (Fig. 17). If plug is too high, use a suitable flat dowel to position properly.

**Fig. 17 Oil Line Plug**

- 1 - RIGHT OIL GALLERY
2 - CYLINDER BLOCK
3 - OIL FROM FILTER TO SYSTEM
4 - OIL TO FILTER
5 - FROM OIL PUMP
6 - CRANKSHAFT
7 - PLUG

(4) If plug is too low, remove oil pan and No. 4 main bearing cap. Use suitable flat dowel to position properly. Coat outside diameter of plug with Mopar® Stud and

ENGINE BLOCK (Continued)

Bearing Mount Adhesive. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 in.) from bottom of the block.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL—CAMSHAFT BEARINGS

(1) With engine completely disassembled, drive out rear cam bearing core hole plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 18).

Fig. 18 Camshaft Bearings Removal and Installation with Tool C-3132-A

1 - SPECIAL TOOL C-3132A

REMOVAL—CAMSHAFT

- (1) Disconnect battery negative cable.
- (2) Remove radiator. (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
- (3) Remove intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- (4) Remove distributor assembly. Refer to Ignition Systems for the correct procedure.
- (5) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (6) Remove rocker arms.
- (7) Remove push rods and tappets (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - REMOVAL). Identify each part so it can be installed in the original locations.
- (8) Remove timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- (9) Align timing marks (Fig. 19) and remove timing chain and sprockets.
- (10) Remove the three tensioner to block mounting bolts and remove tensioner.

(11) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

Fig. 19 Alignment of Timing Marks

1 - TIMING MARKS

INSTALLATION—CAMSHAFT BEARINGS

- (1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.
- (2) Position rear bearing in the tool. Install horseshoe lock and, by reversing removal procedure, carefully drive bearing shell into place.
- (3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

INSTALLATION—CAMSHAFT

- (1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft to within 51 mm (2 inches) of its final position in cylinder block.
- (2) Install Camshaft Holding Tool C-3509 with tongue back of distributor drive gear (Fig. 20).
- (3) Hold tool in position with a distributor lock-plate bolt. This tool will restrict camshaft from being pushed in too far and prevent knocking out the welch plug in rear of cylinder block. **Tool should remain**

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

Fig. 20 Camshaft Holding Tool C-3509 (Installed Position)

installed until the camshaft and crankshaft sprockets and timing chain have been installed.

(4) Install timing chain tensioner. Torque bolts to 24 N·m (210 in. lbs.) torque.

(5) Compress tensioner shoe (Fig. 21) and install a suitable sized pin to retain shoe for chain installation.

(6) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on an exact imaginary center line through both camshaft and crankshaft bores.

Fig. 22 Alignment of Timing Marks

- 1 - TIMING MARKS

Fig. 23 Checking Camshaft End Play

- 1 - SCREWDRIVER
- 2 - DIAL INDICATOR
- 3 - CAM SPROCKET

(7) Place timing chain around both sprockets.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(8) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(9) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(10) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 22).

(11) Install the camshaft bolt/cup washer. Tighten bolt to 68 N·m (50 ft. lbs.) torque.

(12) Measure camshaft end play (Fig. 23). (Refer to 9 - ENGINE - SPECIFICATIONS) for proper clearance. If not within limits, install a new timing chain tensioner.

(13) Each tappet reused must be installed in the same position at which it was removed. **When camshaft is replaced, all of the tappets must be replaced.** Install hydraulic tappets (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION).

(14) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(15) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(16) Install distributor.

(17) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(18) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(19) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(20) Connect battery negative cable.

(21) Start engine and check for leaks.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Bearings are available in 0.025 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 24) is of a forged steel splayed type design, with four main bearing journals. The crankshaft is located at the bottom of the engine block and is held in place with four main bearing caps.

Undersize Journal	Identification Stamp
ROD - 0.025mm (0.001 in.)	R1-R2-R3-Etc.
MAIN - 0.025mm (0.001 in.)	M1-M2-M3 or M4

STEEL STAMP IDENTIFICATION
R (ROD) AND/OR M (MAIN) FOLLOWED
BY THE ROD OR MAIN NUMBER

Fig. 24 Crankshaft—3.9L Engine

CONNECTING ROD BEARINGS

STANDARD PROCEDURE-CONNECTING ROD BEARING FITTING

Fit all rods on a bank until completed. DO NOT alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, be certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flywheel or flexplate.

REMOVAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Identify bearing caps before removal. Remove bearing caps and bearings one at a time.

(4) Lift the crankshaft out of the block.

CRANKSHAFT (Continued)

(5) Remove and discard the crankshaft rear oil seals.

(6) Remove and discard the front crankshaft oil seal.

INSTALLATION

(1) Lightly oil the new upper seal lips with engine oil.

(2) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.

(3) Position the crankshaft into the cylinder block.

(4) Lightly oil the new lower seal lips with engine oil.

(5) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(6) Apply 5 mm (0.20 in.) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 25). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

Fig. 25 Sealant Application to Bearing Cap

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT SLOTS
- 2 - LOCTITE 515 (OR EQUIVALENT)
- 3 - CAP ALIGNMENT SLOT
- 4 - REAR MAIN BEARING CAP

(7) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(8) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(9) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(10) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap-to-block and oil pan sealing (Fig. 26).

Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(11) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(12) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(13) Install new rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).

CRANKSHAFT MAIN BEARINGS**DESCRIPTION**

Main bearings (Fig. 27) are located in the cylinder block. One half of the main bearing is located in the crankshaft main bore the other half of the matching bearing is located in the main bearing cap. there are four main bearings. Number two main bearing is flanged, this flange controls crankshaft thrust.

OPERATION

The main bearings encircle the crankshaft main bearing journals, this aligns the crankshaft to the centerline of the engine and allows the crankshaft to turn without wobbling or shaking therefore eliminating vibration. The main bearings are available in standard and undersizes.

CRANKSHAFT MAIN BEARINGS (Continued)

Fig. 27 Main Bearing Orientation

STANDARD PROCEDURE—MAIN BEARING FITTING

Bearing caps are NOT interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of No. 1 and 3 are interchangeable.

Upper and lower No. 2 bearing halves are flanged to carry the crankshaft thrust loads. They are NOT interchangeable with any other bearing halves in the engine (Fig. 28). Bearing shells are available in standard and the following undersizes: 0.25 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.). Never install an undersize bearing that will reduce clearance below specifications.

Fig. 28 Main Bearing Identification

CRANKSHAFT IDENTIFICATION LOCATION CHART

ITEM	MEASUREMENT	IDENTIFICATION
ROD U/S	0.025 mm (0.001 in.)	R1-R2-R3 ect. indicates rod journal No. 1, 2 and 3.
MAIN U/S	0.025 mm (0.001 in.)	M1-M2-M3 or M4 indicates main journal No. 1, 2, 3, and 4.

REMOVAL

- (1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
- (3) Identify bearing caps before removal. Remove bearing caps one at a time.
- (4) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 29).
- (5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

Fig. 29 Upper Main Bearing Removal and Installation with Tool C-3059

- 1 - SPECIAL TOOL C-3059
- 2 - BEARING
- 3 - SPECIAL TOOL C-3059
- 4 - BEARING

CRANKSHAFT MAIN BEARINGS (Continued)

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation. DO NOT use a new bearing half with an old bearing half.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 29).

(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.

(3) Install the bearing caps. Clean and oil the bolts. Tighten the capbolts to 115 N·m (85 ft. lbs.) torque.

(4) Install the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(5) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT

DESCRIPTION

The crankshaft rear seal is a two piece viton seal. The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover. One part of the two piece rear seal is located in a slot in the number four (4) crankshaft main bore, the second part of the two piece seal is located in the number four (4) main bearing cap.

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

REMOVAL

The oil seal can be replaced without removing the timing chain cover, provided that the cover is not misaligned.

(1) Disconnect the negative cable from the battery.

(2) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) If front seal is suspected of leaking, check front oil seal alignment to crankshaft. The seal installation/alignment Tool 6635, should fit with minimum interference. If tool does not fit, the cover must be removed and installed properly.

(4) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal bore of cover.

INSTALLATION

(1) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 30). Seat the oil seal in the groove of the tool.

(2) Position the seal and tool onto the crankshaft (Fig. 31).

(3) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 32).

(4) Remove the vibration damper bolt and seal installation tool.

(5) Inspect the seal flange on the vibration damper.

(6) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(7) Connect the negative cable to the battery.

J9309-44

Fig. 30 Placing Oil Seal on Installation Tool 6635

1 - CRANKSHAFT FRONT OIL SEAL

2 - INSTALL THIS END INTO SPECIAL TOOL 6635

CRANKSHAFT OIL SEAL - REAR

DESCRIPTION

The crankshaft rear seal is a two piece viton seal. The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover. One part of the two piece rear seal is located in a slot in the number four (4) crankshaft main bore, the second part of the two piece seal is located in the number four (4) main bearing cap.

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

CRANKSHAFT OIL SEAL - REAR (Continued)

- 3 - TIMING CHAIN COVER

**Fig. 32 Installing Oil Seal**

- 1 - SPECIAL TOOL 6635
- 2 - TIMING CHAIN COVER

REMOVAL

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft

removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Remove the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL). Discard the old upper seal.

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap. Remove and discard the old lower oil seal.

(4) Carefully remove and discard the old upper oil seal.

LOWER SEAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap and discard the old lower seal.

INSTALLATION

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Clean the cylinder block rear cap mating surface. Be sure the seal groove is free of debris. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing toward the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 33). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assem-

CRANKSHAFT OIL SEAL - REAR (Continued)

ble bearing cap to cylinder block immediately after sealant application.

Fig. 33 Sealant Application to Bearing Cap

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT SLOTS
- 2 - MOPAR® GASKET MAKER (OR EQUIVALENT)
- 3 - CAP ALIGNMENT SLOT
- 4 - REAR MAIN BEARING CAP

(8) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(11) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing (Fig. 34). Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(12) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(13) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Clean the cylinder block mating surfaces before oil seal installation. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil. To allow ease of installation of the seal, loosen at least the two main bearing caps forward of the rear bearing cap.

Fig. 34 Apply Sealant to Bearing Cap-to-Block Joint

- 1 - MOPAR® GEN II SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP
- 2 - SEALANT APPLIED
- 3 - CYLINDER BLOCK
- 4 - REAR MAIN BEARING CAP

(3) Rotate the new upper seal into the cylinder block, being careful not to shave or cut the outer surface of the seal. To ensure proper installation, use the installation tool provided with the kit. Install the new seal with the white paint facing toward the rear of the engine.

(4) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing toward the rear of the engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 33). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application. Be sure the white paint faces toward the rear of the engine.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten ALL cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap-to-block and oil pan sealing (Fig. 34). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

CRANKSHAFT OIL SEAL - REAR (Continued)

LOWER SEAL

(1) Clean the rear main cap mating surfaces including the oil pan gasket groove.

(2) Carefully install a new upper seal. Refer to UPPER SEAL—CRANKSHAFT INSTALLED.

(3) Lightly oil the new lower seal lips with engine oil.

(4) Install a new lower seal in bearing cap with the white paint facing the rear of engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 33). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten the cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing. Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

Fig. 35 Distributor Driveshaft Bushing Removal

- 1 - SPECIAL TOOL C-3052
2 - BUSHING

Fig. 36 Distributor Driveshaft Bushing Installation

- 1 - SPECIAL TOOL C-3053
2 - BUSHING

DISTRIBUTOR BUSHING

REMOVAL

(1) Remove distributor.

(2) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(3) Insert Distributor Drive Shaft Bushing Puller Tool C-3052 into old bushing and thread down until a tight fit is obtained (Fig. 35).

(4) Hold puller screw and tighten puller nut until bushing is removed.

INSTALLATION

(1) Slide new bushing over burnishing end of Distributor Drive Shaft Bushing Driver/Burnisher Tool C-3053. Insert the tool and bushing into the bore.

(2) Drive bushing and tool into position, using a hammer (Fig. 36).

(3) As the burnisher is pulled through the bushing, the bushing is expanded tight in the block and burnished to correct size (Fig. 37). **DO NOT ream this bushing.**

CAUTION: This procedure **MUST** be followed when installing a new bushing or seizure to shaft may occur.

Fig. 37 Burnishing Distributor Bushing

- 1 - SPECIAL TOOL C-3053
2 - BUSHING

(4) Install the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(5) Install the distributor.

HYDRAULIC LIFTERS (CAM IN BLOCK)

DIAGNOSIS AND TESTING—HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.

(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the

tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

LEAK-DOWN TEST

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 38).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Universal Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require

HYDRAULIC LIFTERS (CAM IN BLOCK) (Continued)

20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

Fig. 38 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

REMOVAL

- (1) Remove the air cleaner assembly and air in-let hose.
- (2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (3) Remove rocker assembly and push rods. Identify push rods to ensure installation in original locations.
- (4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

- (5) Remove yoke retainer and aligning yokes.

(6) Slide Hydraulic Tappet Remover/Installer Tool C-4129-A through opening in cylinder head and seat tool firmly in the head of tappet.

(7) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(8) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSTALLATION

- (1) Lubricate tappets.
- (2) Install tappets and push rods in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).
- (3) Install aligning yokes with ARROW toward camshaft.
- (4) Install yoke retainer. Tighten the bolts to 23 N·m (200 in. lbs.) torque. Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
- (5) Install push rods in original positions.
- (6) Install rocker arms.
- (7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- (8) Install air cleaner assembly and air in-let hose.
- (9) Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of aluminum and have three ring grooves, the top two grooves are for the compression rings and the bottom groove is for the oil control ring. The connecting rods are forged steel and are coined prior to heat treat. The piston pins are press fit.

STANDARD PROCEDURE—PISTON FITTING

Check the cylinder block bore for out-of-round, taper, scoring, or scuffing.

Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 39).

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 in.) at 21°C (70°F).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

Fig. 39 Piston Measurements

1 - 62.230 mm
(2.45 IN.)

PISTON MEASUREMENTS CHART

PISTON SIZE	A DIA = PISTON DIAMETER		BORE DIAMETER

DESCRIPTION		SPECIFICATION		
PISTON PIN BORE		25.007 - 25.014 mm (.9845 - .9848 in.)		
RING GROOVE HEIGHT (OIL RAIL)		4.0309 - 4.0538 mm (.1587 - .1596 in.)		
RING GROOVE HEIGHT (COMPRESSION RAIL)		2.0294 - 2.0548 mm (.0799 - .0809 in.)		
TOTAL FINISHED WEIGHT		594.6 ± 2 grams (20.974 ± .0706 ounces)		

REMOVAL

(1) Remove the engine from the vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.

(5) Be sure each connecting rod and connecting rod cap is identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing the assemblies from the engine, rotate crankshaft so that

PISTON & CONNECTING ROD (Continued)

the connecting rod is centered in cylinder bore and at BDC. **Be careful not to nick crankshaft journals.**

(7) After removal, install bearing cap on the mating rod.

CLEANING

Clean the piston and connecting rod assembly using a suitable solvent.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(2) Before installing the ring compressor, be sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 40).

J9309-80

Fig. 40 Proper Ring Installation

- 1 - OIL RING SPACER GAP
- 2 - SECOND COMPRESSION RING GAP OIL RING RAIL GAP (TOP)
- 3 - OIL RING RAIL GAP (BOTTOM)
- 4 - TOP COMPRESSION RING GAP

(3) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385). **Be sure position of rings does not change during this operation.**

(4) Install connecting rod bolt protectors on rod bolts. The long protector should be installed on the numbered side of the connecting rod.

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on crankshaft journal.

(7) The notch, or groove, on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(8) Install rod caps. Be sure connecting rod, connecting rod cap, and cylinder bore number are the same. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(9) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(10) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(11) Install the engine into the vehicle (Refer to 9 - ENGINE - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE—PISTON RING FITTING

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 in. from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler gauge in the gap. The top compression ring gap should be between 0.254-0.508 mm (0.010-0.020 in.). The second compression ring gap should be between 0.508-0.762 mm (0.020-0.030 in.). The oil ring gap should be 0.254-1.270 mm (0.010-0.050 in.).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Rings with excess gaps should not be used.

(2) Install rings, and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and

PISTON RINGS (Continued)

lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter "O", an oval depression, or the word "TOP" (Fig. 41) (Fig. 43).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 42) (Fig. 43). An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word "TOP" facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 in.) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 in.) side clearance.

(e) Pistons with insufficient, or excessive, side clearance should be replaced.

J9009-46

Fig. 41 Second Compression Ring Identification (Typical)

- 1 - SECOND COMPRESSION RING (BLACK CAST IRON)
- 2 - CHAMFER
- 3 - TWO DOTS

(3) Orient the rings:

(a) Arrange top compression ring 90° counter-clockwise from the oil ring rail gap (Fig. 44).

(b) Arrange second compression ring 90° clockwise from the oil ring rail gap (Fig. 44).

J9009-48

- 5 - CHAMFER

(3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove the vibration damper pulley.

(5) Remove vibration damper bolt and washer from end of crankshaft.

(6) Install bar and screw from Puller Tool Set C-3688. Install two bolts with washers through the puller tool and into the vibration damper (Fig. 45).

(7) Pull vibration damper off of the crankshaft.

VIBRATION DAMPER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove fan, and fan drive (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

INSTALLATION

(1) Position the vibration damper onto the crankshaft.

(2) Place installing tool, part of Puller Tool Set C-3688, in position and press the vibration damper onto the crankshaft (Fig. 46).

VIBRATION DAMPER (Continued)

J9309-80

(3) Install the crankshaft bolt and washer. Tighten the bolt to 244 N·m (180 ft. lbs.) torque.

(4) Install the crankshaft pulley. Tighten the pulley bolts to 23 N·m (200 in. lbs.) torque.

(5) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Install viscous fan drive and fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(7) Install the fan shroud.

(8) Connect the negative cable to the battery.

FRONT MOUNT

REMOVAL

(1) Disconnect the battery negative cable.

(2) Position fan to ensure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 47).

(6) Remove engine support bracket/cushion bolts (Fig. 47). Remove the support bracket/cushion and heat shields.

J9409-144

Fig. 47 Engine Front Mounts

- 1 - ENGINE MOUNT HEAT SHIELD
- 2 - THRU-BOLT
- 3 - RESTRICTION PADS
- 4 - ENGINE SUPPORT BRACKET/CUSHION

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the through-bolt into the engine support bracket/cushion.

FRONT MOUNT (Continued)

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and through-bolt into support cushion brackets (Fig. 48).

Fig. 48 Positioning Engine Front Mounts J9409-54

- 1 - ENGINE SUPPORT BRACKET/CUSHION
2 - SUPPORT CUSHION BRACKET

- (4) Install through-bolt nuts and tighten the nuts to 102 N·m (75 ft. lbs.) torque.
(5) Lower the vehicle.
(6) Remove lifting fixture.

REAR MOUNT

REMOVAL

- (1) Raise the vehicle on a hoist.
(2) Position a transmission jack in place.
(3) Remove support cushion stud nuts (Fig. 49).
(4) Raise rear of transmission and engine SLIGHTLY.
(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.
(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

- (1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 88 N·m (65 ft. lbs.) torque.
(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 41 N·m (30 ft. lbs.) torque.

Fig. 49 Engine Rear Support Cushion Assemblies

REAR MOUNT (Continued)

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 49).

(4) Install the support cushion bolts and tighten to 41 N·m (30 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

LUBRICATION

DESCRIPTION

A gear-type positive displacement pump (Fig. 50) is mounted at the underside of the rear main bearing cap. The pump uses a pick-up tube and screen assembly to gather engine oil from the oil pan.

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery, which extends the entire length on the right side of the block. The oil then goes down to the No. 1 main bearing, back up to the left side of the block, and into the oil gallery on the left side of the engine.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

RY10B

Fig. 50 Positive Displacement Oil Pump—Typical

- 5 - RETAINER CAP
- 6 - SPRING
- 7 - RELIEF VALVE
- 8 - LARGE CHAMFERED EDGE
- 9 - BOLT
- 10 - COVER
- 11 - OUTER ROTOR

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the No. 1 main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets, which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide holes and the oil drain-back passages in the cylinder head, past the valve tappet area, and then returns to the oil pan (Fig. 51).

LUBRICATION (Continued)

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

- (1) Remove oil pressure sending unit.
- (2) Install Oil Pressure Line and Gauge Tool C-3292. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS).

DIAGNOSIS AND TESTING—ENGINE OIL LEAKS

Begin with a through visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

- (1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
- (2) Add an oil-soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to be sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light source.
- (3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.
- (4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat previous step.
- (5) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method as follows:
 - (6) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.
 - (7) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.
 - (8) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(9) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(10) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(11) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose. Proceed to next step.

(12) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

OIL**STANDARD PROCEDURE—ENGINE OIL****OIL LEVEL INDICATOR (DIPSTICK)**

The engine oil level indicator is located at the right front of the engine, left of the generator on 3.9L engines (Fig. 52).

Fig. 52 Oil Level Indicator Location

- 1 - CYLINDER HEAD COVER
- 2 - ENGINE OIL FILL CAP
- 3 - DIPSTICK
- 4 - ENGINE OIL FILTER
- 5 - FILTER BOSS

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading.

OIL (Continued)

(6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE:

Change engine oil at mileage and time intervals described in the Maintenance Schedule. This information can be found in the owner's manual.

TO CHANGE ENGINE OIL

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Hoist vehicle.

(3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(6) Install drain plug in crankcase.

(7) Change oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(9) Install oil fill cap.

(10) Start engine and inspect for leaks.

(11) Stop engine and inspect oil level.

OIL FILTER**REMOVAL**

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 53).

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 54) of oil and grime.

(6) Install new filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

Fig. 53 Oil Filter Removal—Typical

- 1 - ENGINE OIL FILTER
2 - OIL FILTER WRENCH

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 54) hand tighten filter one full turn, do not over tighten.

(3) Add oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

Fig. 54 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

OIL PAN**REMOVAL**

(1) Disconnect the negative cable from the battery.

(2) Remove engine oil dipstick.

(3) Raise vehicle.

(4) Drain engine oil.

(5) Remove exhaust pipe.

(6) Remove left engine to transmission strut.

(7) Loosen the right side engine support bracket cushion through-bolt nut and raise the engine slightly. Remove oil pan by sliding backward and out.

(8) Remove the one-piece gasket.

OIL PAN (Continued)

CLEANING

Clean the block and pan gasket surfaces.

Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Fabricate four alignment dowels from 5/16 X 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 55).

Fig. 55 Fabrication of Alignment Dowels

- 1 - 5/16" X 1 1/2" BOLT
- 2 - DOWEL
- 3 - SLOT

(3) Install the dowels in the cylinder block (Fig. 56).

(4) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, in the corner of the cap and the cylinder block.

(5) Slide the one-piece gasket over the dowels and onto the block.

(6) Position the oil pan over the dowels and onto the gasket.

(7) Install the oil pan bolts. Tighten the bolts to 24 N·m (215 in. lbs.) torque.

(8) Remove the dowels. Install the remaining oil pan bolts. Tighten these bolts to 24 N·m (215 in. lbs.) torque.

(9) Lower the engine into the support cushion brackets and tighten the through-bolt nut to the proper torque.

Fig. 56 Position of Dowels in Cylinder Block

- 1 - DOWEL
- 2 - DOWEL
- 3 - DOWEL
- 4 - DOWEL

(10) Install the drain plug. Tighten drain plug to 34 N·m (27 ft. lbs.) torque.

(11) Install the engine to transmission strut.

(12) Install exhaust pipe.

(13) Lower vehicle.

(14) Install dipstick.

(15) Connect the negative cable to the battery.

(16) Fill crankcase with oil to proper level.

OIL PRESSURE SENSOR/
SWITCH

DESCRIPTION

The 2-wire, electrical/mechanical engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

OPERATION

The oil pressure sensor uses two circuits. They are:

- A signal to the PCM relating to engine oil pressure
- A sensor ground through the PCM's sensor return

The oil pressure sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on a CCD bus circuit to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

OIL PUMP

REMOVAL

- (1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Remove the oil pump from rear main bearing cap.

DISASSEMBLE

- (1) Remove the relief valve as follows:
 - (a) Remove cotter pin. Drill a 3.175 mm (1/8 in.) hole into the relief valve retainer cap and insert a self-threading sheet metal screw into cap.
 - (b) Clamp screw into a vise and while supporting oil pump, remove cap by tapping pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 57).

RH174

Fig. 57 Oil Pressure Relief Valve

- 1 - OIL PUMP ASSEMBLY
- 2 - COTTER PIN
- 3 - RELIEF VALVE
- 4 - RETAINER CAP
- 5 - SPRING

- (2) Remove oil pump cover (Fig. 58).
- (3) Remove pump outer rotor and inner rotor with shaft (Fig. 58).
- (4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

CLEANING

Use only mild solvents to clean the oil pump. Do not use any abrasive material to clean the oil pump housing or rotors.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump assembly if cover is scratched or grooved.

RY10B

Fig. 58 Oil Pump

- 1 - INNER ROTOR AND SHAFT
- 2 - BODY
- 3 - DISTRIBUTOR DRIVESHAFT (REFERENCE)
- 4 - COTTER PIN
- 5 - RETAINER CAP
- 6 - SPRING
- 7 - RELIEF VALVE
- 8 - LARGE CHAMFERED EDGE
- 9 - BOLT
- 10 - COVER
- 11 - OUTER ROTOR

Lay a straightedge across the pump cover surface (Fig. 59). If a 0.038 mm (0.0015 in.) feeler gauge can be inserted between cover and straightedge, pump assembly should be replaced.

8020cd6e

Fig. 59 Checking Oil Pump Cover Flatness

- 1 - COVER
- 2 - STRAIGHT EDGE
- 3 - FEELER GAUGE

OIL PUMP (Continued)

Measure thickness and diameter of outer rotor. If outer rotor thickness measures 20.9 mm (0.825 in.) or less, or if the diameter is 62.7 mm (2.469 in.) or less, replace outer rotor (Fig. 60).

Fig. 60 Measuring Outer Rotor Thickness

If inner rotor measures 20.9 mm (0.825 in.) or less, replace inner rotor and shaft assembly (Fig. 61).

Fig. 61 Measuring Inner Rotor Thickness

Slide outer rotor into pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 62). If clearance is 0.356 mm (0.014 in.) or more, replace oil pump assembly.

Install inner rotor and shaft into pump body. If clearance between inner and outer rotors is 0.203 mm (0.008 in.) or more, replace shaft and both rotors (Fig. 63).

Place a straightedge across the face of the pump, between bolt holes. If a feeler gauge of 0.102 mm (0.004 in.) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 64).

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

Fig. 62 Measuring Outer Rotor Clearance in Housing

- 1 - PUMP BODY
- 2 - OUTER ROTOR
- 3 - FEELER GAUGE

Fig. 63 Measuring Clearance Between Rotors

- 1 - OUTER ROTOR
- 2 - FEELER GAUGE
- 3 - INNER ROTOR

The relief valve spring has a free length of approximately 49.5 mm (1.95 in.). The spring should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 in.). Replace spring that fails to meet these specifications (Fig. 65).

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

ASSEMBLY

(1) Install pump rotors and shaft, using new parts as required.

(2) Position the oil pump cover onto the pump body. Tighten cover bolts to 11 N·m (95 in. lbs.) torque.

OIL PUMP (Continued)

8020cd71

Fig. 64 Measuring Clearance Over Rotors

- 1 - STRAIGHT EDGE
2 - FEELER GAUGE

RN98

Fig. 65 Proper Installation of Retainer Cap

- 1 - RETAINER CAP
2 - CHAMFER
3 - COTTER KEY

(3) Install the relief valve and spring. Insert the cotter pin.

(4) Tap on a new retainer cap.

(5) Prime oil pump before installation by filling rotor cavity with engine oil.

INSTALLATION

(1) Install oil pump. During installation, slowly rotate pump body to ensure driveshaft-to-pump rotor shaft engagement.

(2) Hold the oil pump base flush against mating surface on No. 4 main bearing cap. Finger-tighten pump attaching bolts. Tighten attaching bolts to 41 N·m (30 ft. lbs.) torque.

(3) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD**DESCRIPTION**

The aluminum intake manifold (Fig. 66) is a single plane design with equal length runners. This manifold uses a separate plenum pan and gasket, therefore the plenum gasket is servicable. It also uses separate flange gaskets and front and rear cross-over gaskets. Extreme care must be used when sealing the gaskets to ensure that excess sealant does not enter the intake runners causing a restriction.

80c071ac

Fig. 66 Intake Manifold with Tightening Sequence—3.9L Engine**OPERATION**

The intake manifold, meters and delivers air to the combustion chambers allowing the fuel delivered by the fuel injectors to ignite, thus producing power.

INTAKE MANIFOLD (Continued)

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS, OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPMs, the area of the suspected leak has been found.
- (4) Repair as required.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).
- (4) Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
- (5) Remove the accessory drive bracket.
- (6) Remove the air cleaner.
- (7) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (8) Disconnect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL) and if so equipped, the speed control and transmission kickdown cables.
- (9) Remove the return spring.
- (10) Remove the distributor cap and wires.
- (11) Disconnect the coil wires.
- (12) Disconnect the heat indicator sending unit wire.
- (13) Disconnect the heater hoses and bypass hose.
- (14) Remove the closed crankcase ventilation and evaporation control systems.
- (15) Remove intake manifold bolts.
- (16) Lift the intake manifold and throttle body out of the engine compartment as an assembly.
- (17) Remove and discard the flange side gaskets and the front and rear cross-over gaskets.

(18) Remove the throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(19) If required, remove the plenum pan and gasket. Discard gasket.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INSTALLATION

(1) If the plenum pan was removed, position a new gasket and install the plenum pan (Fig. 67). Tighten bolts in the following sequence:

- Step 1. Tighten bolts to 5.4 N·m (48 in. lbs.)
- Step 2. Tighten bolts to 9.5 N·m (84 in. lbs.)
- Step 3. Check bolts to 9.5 N·m (84 in. lbs.)

80c071ea

Fig. 67 Plenum Pan Bolt Tightening Sequence

(2) Install the flange gaskets. Ensure that the vertical port alignment tab is resting on the deck face of the block. Also the horizontal alignment tabs must be in position with the mating cylinder head gasket tabs (Fig. 69). The words MANIFOLD SIDE should be visible on the center of each flange gasket.

INTAKE MANIFOLD (Continued)

(3) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, to the four corner joints. An excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket and cross-over gaskets (Fig. 68). The sealant should be approximately 5 mm (0.2 in) in diameter.

(4) Install the front and rear cross-over gaskets.

Fig. 68 Cross-Over Gaskets

- 1 - FRONT CROSS-OVER GASKET
2 - REAR CROSS-OVER GASKET

(5) Using a new gasket, install the throttle body onto the intake manifold (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(6) Carefully lower intake manifold into position on the cylinder block and cylinder heads. After intake manifold is in place, inspect to make sure seals are in place.

(7) Install the intake manifold bolts and tighten as follows (Fig. 70):

- Step 1. Tighten bolts 1 and 2 to 8 N·m (72 in. lbs.) Tighten in alternating steps 1.4 N·m (12 in. lbs.) at a time
- Step 2. Tighten bolts 3 through 12 to 8 N·m (72 in. lbs.)
- Step 3. Check all bolts are torqued to 8 N·m (72 in. lbs.)
- Step 4. Tighten all bolts in sequence to 16 N·m (12 ft. lbs.)
- Step 5. Check all bolts are torqued to 16 N·m (12 ft. lbs.)

80c071ae

- 1 - FLANGE GASKET
2 - ALIGNMENT TABS
3 - CYLINDER HEAD GASKET

80c071ac

Fig. 70 Intake Manifold Bolt Tightening Sequence

INTAKE MANIFOLD (Continued)

- (8) Install closed crankcase ventilation and evaporation control systems.
- (9) Connect the coil wires.
- (10) Connect the heat indicator sending unit wire.
- (11) Connect the heater hoses and bypass hose.
- (12) Install distributor cap and wires.
- (13) Hook up the return spring.
- (14) Connect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION) and if so equipped, the speed control and transmission kick-down cables.
- (15) Install the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (16) Install the accessory drive bracket and A/C Compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).
- (17) Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION) and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (18) Install the air cleaner.
- (19) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (20) Connect the negative cable to the battery.

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds (Fig. 71) are constructed of cast iron and are LOG type with balanced flow. One exhaust manifold is attached to each cylinder head.

Fig. 71 Exhaust Manifolds—3.9L Engine

- 1 - EXHAUST MANIFOLD (RIGHT)
- 2 - EXHAUST MANIFOLD (LEFT)
- 3 - BOLTS & WASHERS
- 4 - NUTS & WASHERS

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise and support the vehicle.
- (3) Disconnect the exhaust pipe from the exhaust manifold (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL).
- (4) Lower the vehicle.
- (5) Remove the exhaust heat shields.
- (6) Remove bolts, nuts and washers attaching manifold to cylinder head.
- (7) Remove manifold from the cylinder head.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

- (1) Position the engine exhaust manifolds on the two studs located on the cylinder head. Install conical washers and nuts on these studs (Fig. 72).
- (2) Install two bolts and conical washers at the inner ends of the engine exhaust manifold outboard arms. Install two bolts **WITHOUT** washers on the center arm of engine exhaust manifold (Fig. 72). Starting at the center arm and working outward, tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.
- (3) Install the exhaust heat shields.
- (4) Raise and support the vehicle.

EXHAUST MANIFOLD (Continued)

- (5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.
- (6) Lower the vehicle.
- (7) Connect the negative cable to the battery.

Fig. 72 Engine Exhaust Manifold Installation—3.9L Engine

 2 - EXHAUST MANIFOLD (LEFT)
 3 - BOLTS & WASHERS
 4 - NUTS & WASHERS

TIMING BELT / CHAIN COVER(S)

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (4) Remove water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).
- (5) Remove power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).
- (6) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (7) Loosen oil pan bolts and remove the front bolt at each side.
- (8) Remove the cover bolts.
- (9) Remove chain case cover and gasket using extreme caution to avoid damaging oil pan gasket.
- (10) From the inside of the cover tap the front crankshaft oil seal outward. Be careful not to damage the timing cover sealing surface.

INSTALLATION

- (1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.
- (2) Using a new cover gasket, carefully install chain case cover to avoid damaging oil pan gasket. Use a small amount of Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

CAUTION: If chain cover is replaced for any reason, be sure the oil hole (passenger side of cover) is plugged.

NOTE: Special Tool 6635 must be used to align cover and seal with crankshaft.

- (3) Position the special tool 6635 onto the crankshaft (Fig. 73).

Fig. 73 Position Special Tool 6635 onto Crankshaft

- 1 - SPECIAL TOOL 6635
 2 - OIL SEAL
 3 - TIMING CHAIN COVER

- (4) Tighten chain case cover bolts to 41 N·m (30 ft. lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.
- (5) Remove special tool 6635.
- (6) Inspect the seal flange on the vibration damper.
- (7) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

TIMING BELT / CHAIN COVER(S) (Continued)

(8) Install water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

(9) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

(10) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(11) Install the cooling system fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(12) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(13) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect the negative cable to the battery.

TIMING BELT/CHAIN TENSIONER

DESCRIPTION

The timing chain tensioner is a stamped steel constant tension mechanical design. It is mounted to the front of the engine, behind the timing chain drive.

OPERATION

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. A nylon covered spring steel arm presses on the timing chain maintaining the correct chain tension.

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

(1) Disconnect battery negative cable.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(4) Rotate crankshaft to align timing marks (Fig. 75) to #1 TDC.

(5) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

(6) Slip crankshaft sprocket onto crankshaft and compress tensioner shoe by placing a large screwdriver between crankshaft sprocket and tensioner shoe (Fig. 74). Compress shoe until hole in shoe lines up with hole in bracket. Slide a suitable pin into the holes (Fig. 74) and remove screwdriver.

(7) If tensioner assembly is to be replaced, remove the three tensioner to block bolts and remove tensioner assembly.

TIMING BELT/CHAIN AND SPROCKETS (Continued)

INSPECTION—MEASURING TIMING CHAIN STRETCH

NOTE: Timing chain tensioner must be removed for this operation.

(1) Place a scale next to the timing chain so that any movement of the chain can be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 76).

Fig. 76 Measuring Timing Chain Wear and Stretch

1 - TORQUE WRENCH
2 - 3.175 MM
(0.125 IN.)

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

INSTALLATION

(1) If tensioner assembly is being replaced, install tensioner and mounting bolts. Torque bolts to 24 N·m (210 in. lbs.).

(2) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on an exact imaginary center line through both camshaft and crankshaft bores.

(3) Place timing chain around both sprockets.

(4) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(5) Slide both sprockets evenly over their respective shafts and verify alignment of timing marks (Fig. 77) with a straight-edge if necessary.

Fig. 77 Alignment of Timing Marks

1 - TIMING MARKS

(6) Install the camshaft bolt. Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(7) **Remove tensioner pin.** Again, verify alignment of timing marks.

(8) Install timing cover (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(9) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(10) Connect battery negative cable.

(11) Start engine and check for oil and coolant leaks.

ENGINE 5.2L**DESCRIPTION**

The 5.2 Liter (318 CID) eight-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

Engine lubrication system consists of a rotor type oil pump and a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2 (Fig. 1).

The engine serial number is stamped into a machined pad located on the left, front corner of the cylinder block. When component part replacement is necessary, use the engine type and serial number for reference (Fig. 2).

**DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS
- INTRODUCTION**

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to 14 - FUEL SYSTEM for fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Clean or replace relief valve. 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> 1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals. 	<ol style="list-style-type: none"> 1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

ENGINE 5.2L (Continued)

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING—CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART below

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE 5.2L (Continued)

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

ENGINE 5.2L (Continued)

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60

strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 3).

Fig. 3 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

REMOVAL

(1) Disconnect the battery negative cable.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Recover refrigerant from a/c system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(4) Remove the a/c condenser, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

ENGINE 5.2L (Continued)

(5) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

(6) Remove the washer bottle from the fan shroud.

(7) Remove the viscous fan/drive (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(8) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(9) Remove the upper crossmember and top core support.

(10) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(11) Remove the A/C compressor with the lines attached. Secure compressor out of the way.

(12) Remove generator assembly (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(13) Remove the air cleaner resonator and duct work as an assembly.

(14) Disconnect the throttle linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL).

(15) Remove throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(16) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(17) Remove the distributor cap and wiring.

(18) Disconnect the heater hoses.

(19) Disconnect the power steering hoses, if equipped.

(20) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(21) Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(22) On Manual Transmission vehicles, remove the shift lever (Refer to 21 - TRANSMISSION/TRAN-SAXLE/MANUAL/SHIFT COVER - REMOVAL).

(23) Raise and support the vehicle on a hoist and drain the engine oil.

(24) Remove engine front mount thru-bolt nuts.

(25) Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.

(26) Disconnect exhaust pipe at manifolds.

(27) Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(28) Remove the dust shield and transmission inspection cover.

(29) Remove drive plate to converter bolts (Automatic transmission equipped vehicles).

(30) Remove transmission bell housing to engine block bolts.

(31) Lower the vehicle.

(32) Install an engine lifting fixture.

(33) Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install engine lifting device.

(3) Lower engine into compartment and align engine with transmission:

- Manual Transmission: Align clutch disc assembly (if disturbed). Install transmission input shaft into clutch disc while mating engine and transmission surfaces. Install two transmission to engine block mounting bolts finger tight.

- Automatic Transmission: Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.

(4) Lower engine assembly until engine mount through bolts rest in mount perches.

(5) Install remaining transmission to engine block mounting bolts and tighten.

(6) Tighten engine mount through bolts.

(7) Install drive plate to torque converter bolts. (Automatic transmission models)

(8) Install the dust shield and transmission cover.

(9) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(10) Install exhaust pipe to manifold.

(11) Install the transmission cooler line brackets to the oil pan.

(12) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(13) Lower the vehicle.

(14) Remove engine lifting fixture.

(15) On Manual Transmission vehicles, install the shift lever (Refer to 21 - TRANSMISSION/TRAN-SAXLE/MANUAL/SHIFT COVER - INSTALLATION).

(16) Connect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Connect the power steering hoses, if equipped.

(18) Connect the heater hoses.

(19) Install the distributor cap and wiring.

(20) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

ENGINE 5.2L (Continued)

(21) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(22) Connect the throttle linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION).

(23) Install the air cleaner resonator and duct work..

(24) Install the generator and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(25) Install a/c compressor and lines (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(26) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(27) Install upper radiator support crossmember.

(28) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(29) Connect the radiator lower hose.

(30) Connect the transmission oil cooler lines to the radiator.

(31) Install the fan shroud.

(32) Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(33) Connect the radiator upper hose.

(34) Install the washer bottle.

(35) Install the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(36) Connect the transmission cooler lines.

(37) If equipped, install the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(38) Evacuate and charge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(39) Add engine oil to crankcase (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(40) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(41) Connect battery negative cable.

(42) Start engine and inspect for leaks.

(43) Road test vehicle.

CYLINDER HEAD

DESCRIPTION—CYLINDER HEAD

The cast iron cylinder heads (Fig. 4) are mounted to the cylinder block using ten bolts. The spark plugs are located in the peak of the wedge between the valves.

Fig. 4 Cylinder Head Assembly—V-8 Gas Engines

- 1 - EXHAUST VALVE
- 2 - SPARK PLUGS
- 3 - EXHAUST VALVES
- 4 - SPARK PLUGS
- 5 - EXHAUST VALVE
- 6 - INTAKE VALVES
- 7 - INTAKE VALVES

DESCRIPTION—CYLINDER COVER GASKET

The cylinder head cover gasket (Fig. 5) is a steel-backed silicone gasket, designed for long life usage.

Fig. 5 Cylinder Head Cover Gasket V-8 Gas Engines

- 1 - CYLINDER HEAD COVER GASKET

OPERATION—CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the

exhaust gases out, depending on the stroke of the engine.

OPERATION

The steel-backed silicone gasket is designed to seal the cylinder head cover for long periods of time through extensive heat and cold, without failure. The gasket is designed to be reusable.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

• Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

CYLINDER HEAD (Continued)

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the air cleaner resonator and duct work.
- (4) Remove the intake manifold-to-generator bracket support rod. Remove the generator.
- (5) Remove closed crankcase ventilation system.
- (6) Disconnect the evaporation control system.
- (7) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (8) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.
- (9) Remove distributor cap and wires.
- (10) Disconnect the coil wires.
- (11) Disconnect heat indicator sending unit wire.
- (12) Disconnect heater hoses and bypass hose.
- (13) Remove cylinder head covers and gaskets (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (14) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL) and throttle body as an assembly. Discard the flange side gaskets and the front and rear cross-over gaskets.
- (15) Remove exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
- (16) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.

(17) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(18) Remove spark plugs.

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. If out-of-flatness exceeds 0.00075mm (0.0001in.) times the span length in any direction, either replace head or lightly machine the head surface.

FOR EXAMPLE:—A 305 mm (12 in.) span is 0.102 mm (0.004 in.) out-of-flat. The allowable out-of-flat is 305×0.00075 (12×0.00075) equals 0.23 mm (0.009 in.). This amount of out-of-flat is acceptable.

The cylinder head surface finish should be 1.78-3.00 microns (70-125 microinches).

Inspect push rods. Replace worn or bent rods.

INSTALLATION

- (1) Clean all surfaces of cylinder block and cylinder heads.
- (2) Clean cylinder block front and rear gasket surfaces using a suitable solvent.
- (3) Position new cylinder head gaskets onto the cylinder block.
- (4) Position cylinder heads onto head gaskets and cylinder block.
- (5) Starting at top center, tighten all cylinder head bolts, in sequence (Fig. 6).

Fig. 6 Cylinder Head Bolt Tightening Sequence

CYLINDER HEAD (Continued)

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

(6) Install push rods and rocker arm assemblies in their original position. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(7) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION) and throttle body assembly.

(8) Install exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).

(9) If required, adjust spark plugs to specifications. Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(10) Install coil wire.

(11) Connect heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(15) Install the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(16) Install the generator and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque. Tighten the adjusting strap bolt to 23 N·m (200 in. lbs.) torque.

(17) Install the intake manifold-to-generator bracket support rod. Tighten the bolts.

(18) Place the cylinder head cover gaskets in position and install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(19) Install closed crankcase ventilation system.

(20) Connect the evaporation control system.

(21) Install the air cleaner.

(22) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(23) Connect the negative cable to the battery.

(24) Start engine check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

NOTE: A steel backed silicon gasket is used with the cylinder head cover (Fig. 7). This gasket can be used again.

(1) Disconnect the negative cable from the battery.

J9209-105

Fig. 7 Cylinder Head Cover Gasket

1 - CYLINDER HEAD COVER GASKET

(2) Disconnect the spark plug wires from the spark plugs and set aside.

(3) Disconnect closed ventilation system and evaporation control system from cylinder head cover.

(4) Remove cylinder head cover and gasket.

CLEANING

Clean cylinder head cover gasket surface.

Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.

Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

(1) The cylinder head cover gasket can be used again. Install the gasket onto the head rail.

(2) Position the cylinder head cover onto the gasket. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(3) Install closed crankcase ventilation system and evaporation control system.

(4) Connect the spark plug wires to the spark plugs.

(5) Connect the negative cable to the battery.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

Both the intake and exhaust valves are made of steel. The intake valve is 48.768 mm (1.92 inches) in diameter and the exhaust valve is 41.148 mm (1.62 inches) in diameter and has a 2.032 mm (0.080 inch) wafer interior welded to the tip for durability. These valves are not splayed.

INTAKE/EXHAUST VALVES & SEATS (Continued)

STANDARD PROCEDURE—VALVES, GUIDES AND SPRINGS

VALVE CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

VALVE GUIDES

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 8). The special sleeve places the valve at the correct height for checking with a dial indicator.

Fig. 8 Positioning Valve with Tool C-3973

- 1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 9).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

VALVE GUIDES

Service valves with oversize stems are available. Refer to REAMER SIZES CHART

Fig. 9 Measuring Valve Guide Wear

- 1 - VALVE
2 - SPECIAL TOOL C-3339

REAMER SIZES CHART

REAMER O/S	VALVE GUIDE SIZE
0.076 mm (0.003 in.)	8.026 - 8.052 mm (0.316 - 0.317 in.)
0.381 mm (0.015 in.)	8.331 - 8.357 mm (0.328 - 0.329 in.)

(1) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 in.). Use a two step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

INTAKE/EXHAUST VALVES & SEATS (Continued)

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a $43\frac{1}{4}^{\circ}$ to $43\frac{3}{4}^{\circ}$ face angle and a $44\frac{1}{4}^{\circ}$ to $44\frac{3}{4}^{\circ}$ seat angle (Fig. 10).

80ba7a5f

Fig. 10 Valve Face and Seat Angles

1 - CONTACT POINT

A,B,C and D Refer to VALVE FACE AND VALVE SEAT ANGLE CHART

VALVE FACE AND VALVE SEAT ANGLE CHART

ITEM	DESCRIPTION	SPECIFICATION
A	SEAT WIDTH INTAKE	1.016 - 1.524 mm (0.040 - 0.060 in.)
	EXHAUST	1.524 - 2.032 mm (0.060 - 0.080 in.)
B	FACE ANGLE (INT. AND EXT.)	$43\frac{1}{4}^{\circ}$ - $43\frac{3}{4}^{\circ}$
C	SEAT ANGLE (INT. AND EXT.)	$44\frac{1}{4}^{\circ}$ - $44\frac{3}{4}^{\circ}$
D	CONTACT SURFACE	—

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 11). Valves with less than 1.190 mm (0.047 in.) margin should be discarded.

J9209-127

Fig. 11 Intake and Exhaust Valves

1 - MARGIN

2 - VALVE SPRING RETAINER LOCK GROOVE

3 - STEM

4 - FACE

VALVE SEATS

CAUTION: DO NOT un-shroud valves during valve seat refacing (Fig. 12).

**Fig. 12 Refacing Valve Seats**

1 - STONE

2 - PILOT

3 - VALVE SEAT

4 - SHROUD

INTAKE/EXHAUST VALVES & SEATS (Continued)

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 in.) total indicator reading.

(3) Inspect the valve seat with Prussian blue, to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of intake seats should be 1.016-1.524 mm (0.040-0.060 in.). The width of the exhaust seats should be 1.524-2.032 mm (0.060-0.080 in.).

VALVE SPRINGS

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 in.. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 in. mark on the threaded stud. Be sure the zero mark is to the front (Fig. 13). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

REMOVAL

(1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Compress valve springs using Valve Spring Compressor Tool MD- 998772A and adapter 6716A.

(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

9509-79

Fig. 13 Testing Valve Spring for Compressed Length

1 - TORQUE WRENCH
2 - VALVE SPRING TESTER

INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 14). The special sleeve places the valve at the correct height for checking with a dial indicator.

J9509-49

Fig. 14 Positioning Valve with Tool C-3973

1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 15).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 15 Measuring Valve Guide Wear**

- 1 - VALVE
2 - SPECIAL TOOL C-3339

INSTALLATION

- (1) Clean valves thoroughly. Discard burned, warped and cracked valves.
- (2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
- (3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
- (4) Coat valve stems with lubrication oil and insert them in cylinder head.
- (5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.
- (6) Install new seals on all valve guides. Install valve springs and valve retainers.
- (7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. This should bring spring height back to normal 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).
- (8) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

ROCKER ARM / ADJUSTER ASSEMBLY**REMOVAL**

- (1) Remove cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (2) Remove the rocker arm bolts and pivots (Fig. 16). Place them on a bench in the same order as removed.
- (3) Remove the push rods and place them on a bench in the same order as removed.

**Fig. 16 Rocker Arms**

- 1 - ROCKER ARMS
2 - CYLINDER HEAD

INSTALLATION

- (1) Rotate the crankshaft until the "V8" mark lines up with the TDC mark on the timing chain case cover. This mark is located 147° ATDC from the No.1 firing position.
- (2) Install the push rods in the same order as removed.
- (3) Install rocker arm and pivot assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

- (4) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ENGINE BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leakage.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper. Refer to Honing Cylinder Bores in the Service Procedures portion of this Section.

Inspect the oil line plug, the oil line plug is located in the vertical passage at the rear of the block between the oil-to-filter and oil-from-filter passages (Fig. 17). Improper installation or missing plug could cause erratic, low, or no oil pressure.

The oil plug must come out the bottom. Use flat dowel, down the oil pressure sending unit hole from the top, to remove oil plug.

- (1) Remove oil pressure sending unit from back of block.
- (2) Insert a 3.175 mm (1/8 in.) finish wire, or equivalent, into passage.
- (3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 in.) from machined surface of block (Fig. 17). If plug is too high, use a suitable flat dowel to position properly.

Fig. 17 Oil Line Plug

- 1 - RIGHT OIL GALLERY
- 2 - CYLINDER BLOCK
- 3 - OIL FROM FILTER TO SYSTEM
- 4 - OIL TO FILTER
- 5 - FROM OIL PUMP
- 6 - CRANKSHAFT
- 7 - PLUG

J9209-147

- (4) If plug is too low, remove oil pan and No. 4 main bearing cap. Use suitable flat dowel to position properly. Coat outside diameter of plug with Mopar® Stud and Bearing Mount Adhesive. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 in.) from bottom of the block.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL—CAMSHAFT BEARINGS

NOTE: This procedure requires that the engine is removed from the vehicle.

- (1) With engine completely disassembled, drive out rear cam bearing core plug.

- (2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 18).

Fig. 18 Camshaft Bearings

- 1 - SPECIAL TOOL C-3132-A
- 2 - MAIN BEARING OIL HOLE

REMOVAL—CAMSHAFT

NOTE: The camshaft has an integral oil pump and distributor drive gear (Fig. 19).

Fig. 19 Camshaft and Sprocket Assembly

- 1 - THRUST PLATE
- 2 - OIL PUMP AND DISTRIBUTOR DRIVE GEAR INTEGRAL WITH CAMSHAFT
- 3 - CAMSHAFT SPROCKET

J9309-71

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

- (1) Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
- (2) Remove the A/C Condenser (if equipped)
- (3) Remove the engine cover.
- (4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- (5) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (6) Remove timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL) and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
- (7) Remove rocker arms.
- (8) Remove push rods and tappets. Identify each part so it can be installed in its original location.
- (9) Remove distributor and lift out the oil pump and distributor drive shaft.
- (10) Remove camshaft thrust plate, note location of oil tab (Fig. 20).

Fig. 20 Timing Chain Oil

- 1 - THRUST PLATE FRONT SIDE
- 2 - CHAIN OIL TAB
- 3 - THRUST PLATE REAR SIDE

(11) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSTALLATION—CAMSHAFT BEARINGS

- (1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.
- (2) Position rear bearing in the tool. Install horse-shoe lock and by reversing removal procedure, carefully drive bearing shell into place.
- (3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

INSTALLATION—CAMSHAFT

- (1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft to within 51 mm (2 inches) of its final position in cylinder block.
- (2) Install Camshaft Holder Tool C-3509 with tongue back of distributor drive gear (Fig. 21).

Fig. 21 Camshaft Holding Tool C-3509 (Installed Position)

- 1 - SPECIAL TOOL C-3509
- 2 - DRIVE GEAR
- 3 - DISTRIBUTOR LOCK BOLT

(3) Hold tool in position with a distributor lock-plate bolt. This tool will restrict camshaft from being pushed in too far and prevent knocking out the welch plug in rear of cylinder block. **Tool should remain installed until the camshaft and crankshaft sprockets and timing chain have been installed.**

(4) Install camshaft thrust plate and chain oil tab. **Make sure tang enters lower right hole in thrust plate.** Tighten bolts to 24 N·m (210 in. lbs.) torque. Top edge of tab should be flat against thrust plate in order to catch oil for chain lubrication.

(5) Install timing chain and gears (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Measure camshaft end play (Refer to 9 - ENGINE - SPECIFICATIONS). If not within limits install a new thrust plate.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(7) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

(8) Install distributor and distributor drive shaft.

(9) Install push rods and tappets.

(10) Install rocker arms.

(11) Install timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(14) Install the engine cover.

(15) Install the A/C Condenser (if equipped)

(16) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(17) Start engine check for leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE—CONNECTING ROD BEARING FITTING

Fit all rods on a bank until completed. DO NOT alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, be certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Bearings are available in 0.025 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 22) is of a cast nodular steel splayed type design, with five main bearing journals. The crankshaft is located at the bottom of the engine block and is held in place with five main bearing caps. The number 3 counterweight is the location for journal size identification.

Undersize Journal	Identification Stamp
0.025 mm (0.001 inch) (Rod)	R1-R2-R3 or R4
0.025 mm (0.001 inch) (Main)	M1-M2-M3-M4 or M5

Fig. 22 Crankshaft with Journal Size Identification

OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flywheel or flexplate.

REMOVAL

NOTE: This procedure can be done in vehicle. However the transmission must be removed first.

(1) If crankshaft is to be removed while engine is in vehicle remove the transmission. Refer to Group 21, for correct procedure.

(2) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove the oil pump from the rear main bearing cap (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(4) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(5) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(6) Identify rod bearing caps before removal. Remove rod bearing caps with bearings.

CRANKSHAFT (Continued)

CAUTION: Support crankshaft before removing main bearing caps. failure to do so will allow the crankshaft to fall damaging the crankshaft.

- (7) Using a suitable jack, support the crankshaft.
- (8) Identify main bearing caps before removal. Remove main bearing caps and bearings one at a time.
- (9) Lower the crankshaft out of the block.
- (10) Remove and discard the crankshaft rear oil seals.
- (11) Remove and discard the front crankshaft oil seal.

INSTALLATION

- (1) Clean Gasket Maker residue and sealant from the cylinder block and rear cap mating surface. Do this before applying the Mopar® Gasket Maker and the installation of rear cap.
- (2) Lightly oil the new upper seal lips with engine oil.
- (3) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.
- (4) Position the crankshaft into the cylinder block.
- (5) Lightly oil the new lower seal lips with engine oil.
- (6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.
- (7) Apply 5 mm (0.20 in) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 23). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

J9509-75

Fig. 23 Sealant Application to Bearing Cap

1 - .25 DROP OF LOCTITE 515 ON BOTH SIDES OF REAR MAIN CAP

- (8) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess

material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

- (9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

- (10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

- (11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

- (12) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

- (13) Position the connecting rods onto the crankshaft and install the rod bearing caps. Tighten the nuts to 61 N·m (45 ft. lbs.).

- (14) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 24). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

- (15) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

- (16) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

J9309-87

Fig. 24 Apply Sealant to Bearing Cap to Block Joint

- 1 - MOPAR® GEN II SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP

- (17) If the transmission was removed, install the transmission.

CRANKSHAFT MAIN BEARINGS

DESCRIPTION

Main bearings (Fig. 25) are located in the cylinder block. One half of the main bearing is located in the crankshaft main bore the other half of the matching bearing is located in the main bearing cap. there are five main bearings. Number three main bearing is flanged, this flange controls crankshaft thrust.

Fig. 25 Main Bearing Orientation

OPERATION

The main bearings encircle the crankshaft main bearing journals, this aligns the crankshaft to the centerline of the engine and allows the crankshaft to turn without wobbling or shaking therefore eliminating vibration. The main bearings are available in standard and undersizes.

STANDARD PROCEDURE—CRANKSHAFT MAIN BEARING FITTING

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of No.2 and 4 are interchangeable.

Upper and lower No.3 bearing halves are flanged to carry the crankshaft thrust loads. They are NOT interchangeable with any other bearing halves in the engine (Fig. 26). Bearing shells are available in standard and the following undersizes: Never install an undersize bearing that will reduce clearance below specifications.

Main Bearing Undersize Availability List

- 0.25 mm (0.001 inch)
- 0.051 mm (0.002 inch)
- 0.076 mm (0.003 inch)
- 0.254 mm (0.010 inch)
- 0.305 mm (0.012 inch)

Fig. 26 Main Bearing

REMOVAL

- (1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Remove the oil pump from the rear main bearing cap (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
- (3) Identify bearing caps before removal. Remove bearing caps one at a time.
- (4) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 27).
- (5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

- (1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 27).
- (2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.
- (3) Install the bearing caps. Clean and oil the bolts. Tighten the capbolts to 115 N·m (85 ft. lbs.) torque.
- (4) Install the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

CRANKSHAFT MAIN BEARINGS (Continued)

(5) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(6) Start engine check for leaks.

CRANKSHAFT OIL SEAL - FRONT

DESCRIPTION

The crankshaft rear seal is a two piece viton seal. The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover. One part of the two piece rear seal is located in a slot in the number four (4) crankshaft main bore, the second part of the two piece seal is located in the number four (4) main bearing cap.

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

REMOVAL

The oil seal can be replaced without removing the timing chain cover, provided that the cover is not misaligned.

- (1) Disconnect the negative cable from the battery.
- (2) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (3) If front seal is suspected of leaking, check front oil seal alignment to crankshaft. The seal installa-

tion/alignment Tool 6635, should fit with minimum interference. If tool does not fit, the cover must be removed and installed properly.

(4) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal bore of cover.

INSTALLATION

(1) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 28). Seat the oil seal in the groove of the tool.

(2) Position the seal and tool onto the crankshaft (Fig. 29).

(3) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 30).

(4) Remove the vibration damper bolt and seal installation tool.

(5) Inspect the seal flange on the vibration damper.

(6) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(7) Connect the negative cable to the battery.

J9309-44

Fig. 28 Placing Oil Seal on Installation Tool 6635

- 1 - CRANKSHAFT FRONT OIL SEAL
- 2 - INSTALL THIS END INTO SPECIAL TOOL 6635

CRANKSHAFT OIL SEAL - REAR

DESCRIPTION

The crankshaft rear seal is a two piece viton seal. The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover. One part of the two piece rear seal is located in a slot in the cylinder block opposite the crankshaft main bearing cap, the second part of the two piece seal is located in the main bearing cap itself.

CRANKSHAFT OIL SEAL - REAR (Continued)

**Fig. 29 Position Tool and Seal onto Crankshaft**

- 2 - OIL SEAL
- 3 - TIMING CHAIN COVER

**Fig. 30 Installing Oil Seal**

- 1 - SPECIAL TOOL 6635
- 2 - TIMING CHAIN COVER

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

REMOVAL

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Remove the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL). Discard the old upper seal.

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap. Remove and discard the old lower oil seal.

(4) Carefully remove and discard the old upper oil seal.

LOWER SEAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap and discard the old lower seal.

INSTALLATION

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Clean the cylinder block rear cap mating surface. Be sure the seal groove is free of debris. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing toward the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

CRANKSHAFT OIL SEAL - REAR (Continued)

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

Fig. 31 Sealant Application to Bearing Cap

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT SLOTS
- 2 - MOPAR® GASKET MAKER (OR EQUIVALENT)
- 3 - CAP ALIGNMENT SLOT
- 4 - REAR MAIN BEARING CAP

(8) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(11) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing (Fig. 32). Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(12) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(13) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

Fig. 32 Apply Sealant to Bearing Cap-to-Block Joint

- 1 - MOPAR® GEN II SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP
- 2 - SEALANT APPLIED
- 3 - CYLINDER BLOCK
- 4 - REAR MAIN BEARING CAP

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Clean the cylinder block mating surfaces before oil seal installation. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil. To allow ease of installation of the seal, loosen at least the two main bearing caps forward of the rear bearing cap.

(3) Rotate the new upper seal into the cylinder block, being careful not to shave or cut the outer surface of the seal. To ensure proper installation, use the installation tool provided with the kit. Install the new seal with the white paint facing toward the rear of the engine.

(4) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing toward the rear of the engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application. Be sure the white paint faces toward the rear of the engine.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten ALL cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

CRANKSHAFT OIL SEAL - REAR (Continued)

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap-to-block and oil pan sealing (Fig. 32). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

LOWER SEAL

(1) Clean the rear main cap mating surfaces including the oil pan gasket groove.

(2) Carefully install a new upper seal. Refer to UPPER SEAL—CRANKSHAFT INSTALLED.

(3) Lightly oil the new lower seal lips with engine oil.

(4) Install a new lower seal in bearing cap with the white paint facing the rear of engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten the cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing. Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

DISTRIBUTOR BUSHING

REMOVAL

(1) Remove distributor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/DISTRIBUTOR - REMOVAL).

(2) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(3) Insert Distributor Drive Shaft Bushing Puller Tool C-3052 into old bushing and thread down until a tight fit is obtained (Fig. 33).

(4) Hold puller screw and tighten puller nut until bushing is removed.

Fig. 33 Distributor Driveshaft Bushing Removal

1 - SPECIAL TOOL C-3052

2 - BUSHING

INSTALLATION

(1) Slide new bushing over burnishing end of Distributor Drive Shaft Bushing Driver/Burnisher Tool C-3053. Insert the tool and bushing into the bore.

(2) Drive bushing and tool into position, using a hammer (Fig. 34).

Fig. 34 Distributor Driveshaft Bushing Installation

1 - SPECIAL TOOL C-3053

2 - BUSHING

(3) As the burnisher is pulled through the bushing, the bushing is expanded tight in the block and burnished to correct size (Fig. 35). **DO NOT ream this bushing.**

CAUTION: This procedure **MUST** be followed when installing a new bushing or seizure to shaft may occur.

DISTRIBUTOR BUSHING (Continued)

Fig. 35 Burnishing Distributor Driveshaft Bushing

- 1 - SPECIAL TOOL C-3053
2 - BUSHING

(4) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD INSTALLATION).

(5) Install the distributor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/DISTRIBUTOR INSTALLATION).

HYDRAULIC LIFTERS (CAM IN BLOCK)

DIAGNOSIS AND TESTING—HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.

(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

LEAK-DOWN TEST

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 36).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Universal Leak-Down Tester.

HYDRAULIC LIFTERS (CAM IN BLOCK) (Continued)

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

Fig. 36 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

REMOVAL

(1) Remove the air cleaner assembly and air in-let hose.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove rocker assembly and push rods. Identify push rods to ensure installation in original locations.

(4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(5) Remove yoke retainer and aligning yokes.

(6) Slide Hydraulic Tappet Remover/Installer Tool C-4129-A through opening in cylinder head and seat tool firmly in the head of tappet.

(7) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(8) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSTALLATION

(1) Lubricate tappets.

(2) Install tappets and push rods in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).

(3) Install aligning yokes with ARROW toward camshaft.

(4) Install yoke retainer. Tighten the bolts to 23 N·m (200 in. lbs.) torque. Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(5) Install push rods in original positions.

(6) Install rocker arms.

(7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(8) Install air cleaner assembly and air in-let hose.

(9) Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

PISTON & CONNECTING ROD

PISTON MEASUREMENTS CHART

DESCRIPTION

The pistons are made of aluminum and have three ring grooves, the top two grooves are for the compression rings and the bottom groove is for the oil control ring. The connecting rods are forged steel and are coined prior to heat treat. The piston pins are press fit.

STANDARD PROCEDURE—PISTON FITTING

Check the cylinder block bore for out-of-round, taper, scoring, or scuffing.

Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 37).

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 in.) at 21°C (70°F).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

Fig. 37 Piston Measurements

1 - 62.230 mm (2.45 IN.)

PISTON SIZE	A DIA = PISTON DIAMETER		BORE DIAMETER	
	MIN. mm (in.)	MAX. mm (in.)	MIN. mm (in.)	MAX. mm (in.)
A	99.280 (3.9087)	99.294 (3.9092)	99.308 (3.9098)	99.320 (3.9103)
B	99.294 (3.9092)	99.306 (3.9097)	99.320 (3.9103)	99.333 (3.9108)
C	99.306 (3.9097)	99.319 (3.9102)	99.333 (3.9108)	99.345 (3.9113)
D	99.319 (3.9102)	99.332 (3.9107)	99.346 (3.9113)	99.358 (3.9118)
E	99.332 (3.9107)	99.344 (3.9112)	99.358 (3.9118)	99.371 (3.9123)
DESCRIPTION		SPECIFICATION		
PISTON PIN BORE		25.007 - 25.014 mm (.9845 - .9848 in.)		
RING GROOVE HEIGHT (OIL RAIL)		4.0309 - 4.0538 mm (.1587 - .1596 in.)		
RING GROOVE HEIGHT (COMPRESSION RAIL)		2.0294 - 2.0548 mm (.0799 - .0809 in.)		
TOTAL FINISHED WEIGHT		594.6 ± 2 grams (20.974 ± .0706 ounces)		

REMOVAL

(1) Remove the engine from the vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.

(5) Be sure each connecting rod and connecting rod cap is identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing the assemblies from the engine, rotate crankshaft so that

PISTON & CONNECTING ROD (Continued)

the connecting rod is centered in cylinder bore and at BDC. **Be careful not to nick crankshaft journals.**

(7) After removal, install bearing cap on the mating rod.

CLEANING

Clean the piston and connecting rod assembly using a suitable solvent.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(2) Before installing the ring compressor, be sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 38).

J9309-80

Fig. 38 Proper Ring Installation

- 1 - OIL RING SPACER GAP
- 2 - SECOND COMPRESSION RING GAP OIL RING RAIL GAP (TOP)
- 3 - OIL RING RAIL GAP (BOTTOM)
- 4 - TOP COMPRESSION RING GAP

(3) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench

(part of Tool C-385). **Be sure position of rings does not change during this operation.**

(4) Install connecting rod bolt protectors on rod bolts. The long protector should be installed on the numbered side of the connecting rod.

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on crankshaft journal.

(7) The notch, or groove, on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(8) Install rod caps. Be sure connecting rod, connecting rod cap, and cylinder bore number are the same. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(9) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(10) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(11) Install the engine into the vehicle (Refer to 9 - ENGINE - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE—PISTON RING FITTING

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 in. from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler gauge in the gap. The top compression ring gap should be between 0.254-0.508 mm (0.010-0.020 in.). The second compression ring gap should be between 0.508-0.762 mm (0.020-0.030 in.). The oil ring gap should be 0.254-1.270 mm (0.010-0.050 in.).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Rings with excess gaps should not be used.

(2) Install rings, and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

PISTON RINGS (Continued)

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter "O", an oval depression, or the word "TOP" (Fig. 39) (Fig. 41).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 40) (Fig. 41). An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word "TOP" facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 in.) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 in.) side clearance.

(e) Pistons with insufficient, or excessive, side clearance should be replaced.

J9009-46

Fig. 39 Second Compression Ring Identification (Typical)

VIBRATION DAMPER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove fan, and fan drive (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

(3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove the vibration damper pulley.

(5) Remove vibration damper bolt and washer from end of crankshaft.

(6) Install bar and screw from Puller Tool Set C-3688. Install two bolts with washers through the puller tool and into the vibration damper (Fig. 43).

(7) Pull vibration damper off of the crankshaft.

INSTALLATION

(1) Position the vibration damper onto the crankshaft.

(2) Place installing tool, part of Puller Tool Set C-3688, in position and press the vibration damper onto the crankshaft (Fig. 44).

(3) Install the crankshaft bolt and washer. Tighten the bolt to 244 N·m (180 ft. lbs.) torque.

VIBRATION DAMPER (Continued)

- 1 - SPECIAL TOOL C-3688

J9209-83

Fig. 44 Installing Vibration Damper

- 1 - SPECIAL TOOL C-3688

(4) Install the crankshaft pulley. Tighten the pulley bolts to 23 N·m (200 in. lbs.) torque.

(5) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Install viscous fan drive and fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(7) Install the fan shroud.

(8) Connect the negative cable to the battery.

FRONT MOUNT

REMOVAL

(1) Disconnect the battery negative cable.

(2) Position fan to ensure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 45).

(6) Remove engine support bracket/cushion bolts (Fig. 45). Remove the support bracket/cushion and heat shields.

J9409-144

Fig. 45 Engine Front Mounts

- 1 - ENGINE MOUNT HEAT SHIELD
- 2 - THRU-BOLT
- 3 - RESTRICTION PADS
- 4 - ENGINE SUPPORT BRACKET/CUSHION

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the through-bolt into the engine support bracket/cushion.

FRONT MOUNT (Continued)

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and through-bolt into support cushion brackets (Fig. 46).

(4) Install through-bolt nuts and tighten the nuts to 102 N·m (75 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 47).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 88 N·m (65 ft. lbs.) torque.

J9409-54

Fig. 46 Positioning Engine Front Mounts

1 - ENGINE SUPPORT BRACKET/CUSHION

2 - SUPPORT CUSHION BRACKET

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 41 N·m (30 ft. lbs.) torque.

J9509-126

Fig. 47 Engine Rear Support Cushion Assemblies

REAR MOUNT (Continued)

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 49).

(4) Install the support cushion bolts and tighten to 41 N·m (30 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

LUBRICATION

DESCRIPTION

A gear-type positive displacement pump (Fig. 48) is mounted at the underside of the rear main bearing cap. The pump uses a pick-up tube and screen assembly to gather engine oil from the oil pan.

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery, which extends the entire length on the right side of the block. The oil then goes down to the No. 1 main bearing, back up to the left side of the block, and into the oil gallery on the left side of the engine.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

RY10B

Fig. 48 Positive Displacement Oil Pump—Typical

- 5 - RETAINER CAP
- 6 - SPRING
- 7 - RELIEF VALVE
- 8 - LARGE CHAMFERED EDGE
- 9 - BOLT
- 10 - COVER
- 11 - OUTER ROTOR

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the No. 1 main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets, which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide holes and the oil drain-back passages in the cylinder head, past the valve tappet area, and then returns to the oil pan (Fig. 49).

LUBRICATION (Continued)

DIAGNOSIS AND TESTING—ENGINE OIL LEAKS

Begin with a through visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil-soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to be sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light source.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat previous step.

(5) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method as follows:

(6) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(7) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(8) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(9) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(10) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(11) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose. Proceed to next step.

(12) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL**STANDARD PROCEDURE—ENGINE OIL****OIL LEVEL INDICATOR (DIPSTICK)**

The engine oil level indicator is located at the right front of the engine, left of the generator on 3.9L engines (Fig. 50).

Fig. 50 Oil Level Indicator Location

- 1 - CYLINDER HEAD COVER
- 2 - ENGINE OIL FILL CAP
- 3 - DIPSTICK
- 4 - ENGINE OIL FILTER
- 5 - FILTER BOSS

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

(1) Position vehicle on level surface.

(2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.

(3) Wipe dipstick clean.

(4) Install dipstick and verify it is seated in the tube.

OIL (Continued)

(5) Remove dipstick, with handle held above the tip, take oil level reading.

(6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. This information can be found in the owner's manual.

TO CHANGE ENGINE OIL

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Hoist vehicle.

(3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(6) Install drain plug in crankcase.

(7) Change oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(9) Install oil fill cap.

(10) Start engine and inspect for leaks.

(11) Stop engine and inspect oil level.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 51).

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 54) of oil and grime.

(6) Install new filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

Fig. 51 Oil Filter Removal—Typical

- 1 - ENGINE OIL FILTER
2 - OIL FILTER WRENCH

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 52) hand tighten filter one full turn, do not over tighten.

(3) Add oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

Fig. 52 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

OIL PAN

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove engine oil dipstick.

(3) Raise vehicle.

(4) Drain engine oil.

(5) Remove exhaust pipe.

(6) Remove left engine to transmission strut.

(7) Loosen the right side engine support bracket cushion thru-bolt nut and raise the engine slightly. Remove oil pan by sliding backward and out.

(8) Remove the one-piece gasket.

OIL PAN (Continued)

CLEANING

Clean the block and pan gasket surfaces.

Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

(3) If present, trim excess sealant from inside the engine.

(4) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 53).

Fig. 53 Fabrication of Alignment Dowels

- 1 - 5/16" X 1 1/2" BOLT
- 2 - DOWEL
- 3 - SLOT

(5) Install the dowels in the cylinder block (Fig. 54).

Fig. 54 Position of Dowels in Cylinder Block

- 1 - DOWEL
- 2 - DOWEL
- 3 - DOWEL
- 4 - DOWEL

(6) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent in the corner of the cap and the cylinder block.

(7) Slide the one-piece gasket over the dowels and onto the block.

(8) Position the oil pan over the dowels and onto the gasket.

(9) Install the oil pan bolts. Tighten the bolts to 24 N·m (215 in. lbs.) torque.

(10) Remove the dowels. Install the remaining oil pan bolts. Tighten these bolts to 24 N·m (215 in. lbs.) torque.

(11) Lower the engine into the support cushion brackets and tighten the thru bolt nut to the proper torque.

(12) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.

(13) Install the engine to transmission strut.

(14) Install exhaust pipe.

(15) Lower vehicle.

(16) Install dipstick.

(17) Connect the negative cable to the battery.

(18) Fill crankcase with oil to proper level.

OIL PUMP

REMOVAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump from rear main bearing cap.

DISASSEMBLE

(1) Remove the relief valve as follows:

(a) Remove cotter pin. Drill a 3.175 mm (1/8 inch) hole into the relief valve retainer cap and insert a self-threading sheet metal screw.

(b) Clamp screw into a vise and while supporting oil pump, remove cap by tapping pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 55).

RH174

- 8 - LARGE CHAMFERED EDGE
- 9 - BOLT
- 10 - COVER
- 11 - OUTER ROTOR

8020cd6e

Fig. 57 Checking Oil Pump Cover Flatness

- 1 - COVER
- 2 - STRAIGHT EDGE
- 3 - FEELER GAUGE

(2) Remove oil pump cover (Fig. 56).

(3) Remove pump outer rotor and inner rotor with shaft (Fig. 56).

(4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump assembly if cover is scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 57). If a 0.038 mm (0.0015 inch) feeler gauge can be inserted between cover and straightedge, pump assembly should be replaced.

OIL PUMP (Continued)

Measure thickness and diameter of OUTER rotor. If outer rotor thickness measures 20.9 mm (0.825 inch) or less or if the diameter is 62.7 mm (2.469 inches) or less, replace outer rotor (Fig. 58).

RH176

Fig. 58 Measuring Outer Rotor Thickness

If inner rotor measures 20.9 mm (0.825 inch) or less, replace inner rotor and shaft assembly (Fig. 59).

RH177

Fig. 59 Measuring Inner Rotor Thickness

Slide outer rotor into pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 60). If clearance is 0.356 mm (0.014 inch) or more, replace oil pump assembly.

Install inner rotor and shaft into pump body. If clearance between inner and outer rotors is 0.203 mm (0.008 inch) or more, replace shaft and both rotors (Fig. 61).

Place a straightedge across the face of the pump, between bolt holes. If a feeler gauge of 0.102 mm (0.004 inch) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 62).

OIL PUMP (Continued)

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications (Fig. 63).

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

Fig. 63 Proper Installation of Retainer Cap

- 1 - RETAINER CAP
- 2 - CHAMFER
- 3 - COTTER KEY

ASSEMBLE

(1) Install pump rotors and shaft, using new parts as required.

(2) Position the oil pump cover onto the pump body. Tighten cover bolts to 11 N·m (95 in. lbs.) torque.

(3) Install the relief valve and spring. Insert the cotter pin.

(4) Tap on a new retainer cap.

(5) Prime oil pump before installation by filling rotor cavity with engine oil.

INSTALLATION

(1) Install oil pump. During installation slowly rotate pump body to ensure driveshaft-to-pump rotor shaft engagement.

(2) Hold the oil pump base flush against mating surface on No.5 main bearing cap. Finger tighten pump attaching bolts. Tighten attaching bolts to 41 N·m (30 ft. lbs.) torque.

(3) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD

DESCRIPTION

The aluminum intake manifold (Fig. 64) is a single plane design with equal length runners and uses a separate plenum, therefore the manifold does have a plenum gasket. It also uses separate flange gaskets and front and rear cross-over gaskets. Extreme care must be used when sealing the gaskets to ensure that excess sealant does not enter the intake runners causing a restriction. Whenever the intake manifold is removed inspect the plenum pan for evidence of excess oil buildup, this condition indicates that the plenum pan gasket is leaking.

80c071af

Fig. 64 Intake Manifold and Throttle Body—V-8 Gas Engines Typical

- 1 - FUEL RAIL ASSEMBLY
- 2 - FUEL RAIL MOUNTING BOLTS
- 3 - FUEL RAIL CONNECTING HOSES

OPERATION

The intake manifold, meters and delivers air to the combustion chambers allowing the fuel delivered by the fuel injectors to ignite, thus producing power.

INTAKE MANIFOLD (Continued)

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS, OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPMs, the area of the suspected leak has been found.
- (4) Repair as required.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).
- (4) Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
- (5) Remove the accessory drive bracket.
- (6) Remove the air cleaner.
- (7) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (8) Disconnect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL) and if so equipped, the speed control and transmission kickdown cables.
- (9) Remove the return spring.
- (10) Remove the distributor cap and wires.
- (11) Disconnect the coil wires.
- (12) Disconnect the heat indicator sending unit wire.
- (13) Disconnect the heater hoses and bypass hose.
- (14) Remove the closed crankcase ventilation and evaporation control systems.

- (15) Remove intake manifold bolts.
- (16) Lift the intake manifold and throttle body out of the engine compartment as an assembly.
- (17) Remove and discard the flange side gaskets and the front and rear cross-over gaskets.
- (18) Remove the throttle body bolts and lift the throttle body off the intake manifold (Fig. 65). Discard the gasket.

80c071af

Fig. 65 Throttle Body Assembly

- 1 - FUEL RAIL ASSEMBLY
- 2 - FUEL RAIL MOUNTING BOLTS
- 3 - FUEL RAIL CONNECTING HOSES

- (19) If required, remove the plenum pan and gasket. Discard gasket.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INTAKE MANIFOLD (Continued)

INSTALLATION

(1) If removed, position new plenum gasket and install plenum pan (Fig. 66).

(2) Tighten plenum pan mounting bolts as follows:

- Step 1. Tighten bolts to 5.4 N·m (48 in. lbs.)
- Step 2. Tighten bolts to 9.5 N·m (84 in. lbs.)
- Step 3. Check all bolts are at 9.5 N·m (84 in. lbs.)

80c071eb

Fig. 66 Plenum Pan Bolt Tightening Sequence

(3) Install the flange gaskets. Ensure that the vertical port alignment tab is resting on the deck face of the block. Also the horizontal alignment tabs must be in position with the mating cylinder head gasket tabs (Fig. 68). The words MANIFOLD SIDE should be visible on the center of each flange gasket.

(4) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, to the four corner joints. An excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket. The sealant should be approximately 5 mm (0.2 in) in diameter.

(5) Install the front and rear cross-over gaskets (Fig. 67).

(6) Using a new gasket, install the throttle body onto the intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

(7) Carefully lower intake manifold into position on the cylinder block and cylinder heads. After intake manifold is in place, inspect to make sure seals are in place.

80c071ad

Fig. 67 Cross-Over Gaskets

- 1 - FRONT CROSS-OVER GASKET
2 - REAR CROSS-OVER GASKET

80c071ae

Fig. 68 Intake Manifold Flange Gasket Alignment

- 1 - FLANGE GASKET
2 - ALIGNMENT TABS
3 - CYLINDER HEAD GASKET

INTAKE MANIFOLD (Continued)

(8) Install the intake manifold bolts and tighten as follows (Fig. 69):

- Step 1. Tighten bolts 1 through 4 to 8 N·m (72 in. lbs.) Tighten in alternating steps 1.4 N·m (12 in. lbs.) at a time
- Step 2. Tighten bolts 5 through 12 to 8 N·m (72 in. lbs.)
- Step 3. Check all bolts are torqued to 8 N·m (72 in. lbs.)
- Step 4. Tighten all bolts in sequence to 16 N·m (12 ft. lbs.)
- Step 5. Check all bolts are torqued to 16 N·m (12 ft. lbs.)

J9209-60

Fig. 69 Intake Manifold Bolt Tightening Sequence

(9) Install closed crankcase ventilation and evaporation control systems.

- (10) Connect the coil wires.
- (11) Connect the heat indicator sending unit wire.
- (12) Connect the heater hoses and bypass hose.
- (13) Install distributor cap and wires.
- (14) Hook up the return spring.
- (15) Connect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION) and if so equipped, the speed control and transmission kick-down cables.
- (16) Install the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (17) Install the accessory drive bracket and A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).
- (18) Install the generator and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque.
- (19) Install the air cleaner.
- (20) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (21) Connect the negative cable to the battery.

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds (Fig. 70) are constructed of cast iron and are LOG type with balanced flow. One exhaust manifold is attached to each cylinder head.

J9311-11

Fig. 70 Exhaust Manifolds—V-8 Gas Engines Typical

- 1 - EXHAUST MANIFOLD (LEFT)
- 2 - BOLTS & WASHERS
- 3 - NUTS & WASHERS
- 4 - EXHAUST MANIFOLD (RIGHT)
- 5 - BOLTS & WASHERS

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise and support the vehicle.
- (3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
- (4) Lower the vehicle.
- (5) Remove the exhaust heat shields.
- (6) Remove bolts, nuts and washers attaching manifold to cylinder head.
- (7) Remove manifold from the cylinder head.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

Inspect manifold for cracks.

EXHAUST MANIFOLD (Continued)

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

(1) Position the engine exhaust manifolds on the two studs located on the cylinder head. Install conical washers and nuts on these studs (Fig. 71).

(2) Install two bolts and conical washers at the inner ends of the engine exhaust manifold outboard arms. Install two bolts **WITHOUT** washers on the center arm of engine exhaust manifold (Fig. 71). Starting at the center arm and working outward, tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(3) Install the exhaust heat shields.

(4) Raise and support the vehicle.

(5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(6) Lower the vehicle.

(7) Connect the negative cable to the battery.

J9311-11

Fig. 71 Engine Exhaust Manifold Installation—5.2L/5.9L Engines

- 5 - BOLTS & WASHERS

TIMING BELT / CHAIN COVER(S)

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).

(3) Remove power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).

(4) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(5) Loosen oil pan bolts and remove the front bolt at each side.

(6) Remove the cover bolts.

(7) Remove chain case cover and gasket using extreme caution to avoid damaging oil pan gasket.

INSTALLATION

(1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.

(2) The water pump mounting surface must be cleaned.

(3) Using a new cover gasket, carefully install chain case cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

NOTE: Special Tool 6635 must be used to align the front cover and seal with the crankshaft.

(4) Position the special tool 6635 onto the crankshaft (Fig. 72).

(5) Tighten chain case cover bolts to 41 N·m (30 ft.lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

(6) Remove special tool 6635.

(7) Inspect the seal flange on the vibration damper.

(8) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(9) Install water pump and housing assembly using new gaskets (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

(10) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

(11) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install the cooling system fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

TIMING BELT / CHAIN COVER(S) (Continued)

**Fig. 72 Position Special Tool 6635 onto Crankshaft**

- 1 - SPECIAL TOOL 6635
- 2 - OIL SEAL
- 3 - TIMING CHAIN COVER

(13) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(14) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(15) Connect the negative cable to the battery.

(16) Start engine check for leaks.

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove Timing Chain Cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(3) Re-install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align timing marks as shown in (Fig. 73).

(4) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

INSPECTION—MEASURING TIMING CHAIN STRETCH

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

**Fig. 73 Alignment of Timing Marks**

- 1 - TIMING MARKS

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 74).

**Fig. 74 Measuring Timing Chain Stretch**

- 1 - TORQUE WRENCH
- 2 - 3.175 MM (0.125 IN.)

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

TIMING BELT/CHAIN AND SPROCKETS (Continued)

INSTALLATION

(1) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(2) Place timing chain around both sprockets.

(3) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(4) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(5) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 75).

(6) Install the camshaft bolt. Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(7) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

Fig. 75 Alignment of Timing Marks

1 - TIMING MARKS

(8) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

ENGINE 5.9L**DESCRIPTION**

The 5.9 Liter (360 CID) eight-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

The engine lubrication system consists of a rotor type oil pump and a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2 (Fig. 1).

**Fig. 1 Firing Order**

J908D-49

The engine serial number is stamped into a machined pad located on the left, front corner of the cylinder block. When component part replacement is necessary, use the engine type and serial number for reference (Fig. 2).

1NK 5.9L XXXY S PPPPP NNNN

1 = 2001 Model

NK = Toluca Engine

5.9L = Displacement In Liters

XXX = Engine Build Day (e.g., 027 = 27th Day of the Year)

Y = Last Digit of Year Engine Build (0 = 2000)

S = Shift Engine Built

PPPPP = Last 5 Digits of Engine Assembly Part Number

NNNN = Engine Serial Code (1263 = The 1263rd engine built that day)

DIAGNOSIS AND TESTING—ENGINE**DIAGNOSIS - INTRODUCTION**

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to 14 - FUEL SYSTEM for fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

Test and replace as necessary (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL)

DIAGNOSIS AND TESTING— MECHANICAL

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase 2. Thin or diluted oil 3. Low oil pressure 4. Dirt in tappets/lash adjusters 5. Bent push rod(s) 6. Worn rocker arms 7. Worn tappets/lash adjusters 8. Worn valve guides 9. Excessive runout of valve seats or valve faces	1. Check for correct oil level. Adjust oil level by draining or adding as needed 2. Change oil. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) 3. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) for engine oil pressure test/specifications 4. Clean/replace hydraulic tappets/lash adjusters 5. Install new push rods 6. Inspect oil supply to rocker arms and replace worn arms as needed 7. Install new hydraulic tappets/lash adjusters 8. Inspect all valve guides and replace as necessary 9. Grind valves and seats

ENGINE 5.9L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
CONNECTING ROD NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive connecting rod bearing clearance 5. Connecting rod journal out of round 6. Misaligned connecting rods 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) engine oil pressure test/specifications 3. Change oil to correct viscosity. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) for correct procedure/engine oil specifications Measure bearings for correct clearance with plasti-gage. Repair as necessary 5. Replace crankshaft or grind journals 6. Replace bent connecting rods
MAIN BEARING NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive main bearing clearance 5. Excessive end play 6. Crankshaft main journal out of round or worn 7. Loose flywheel or torque converter 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) 3. Change oil to correct viscosity. 4. Measure bearings for correct clearance. Repair as necessary 5. Check crankshaft thrust bearing for excessive wear on flanges 6. Grind journals or replace crankshaft 7. Inspect crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque
LOW OIL PRESSURE	<ol style="list-style-type: none"> 1. Low oil level 2. Faulty oil pressure sending unit 3. Clogged oil filter 4. Worn oil pump 5. Thin or diluted oil 6. Excessive bearing clearance 7. Oil pump relief valve stuck 8. Oil pump suction tube loose, broken, bent or clogged 9. Oil pump cover warped or cracked 	<ol style="list-style-type: none"> 1. Check oil level and fill if necessary 2. Install new sending unit 3. Install new oil filter 4. Replace oil pump assembly. 5. Change oil to correct viscosity. 6. Measure bearings for correct clearance 7. Remove valve to inspect, clean and reinstall 8. Inspect suction tube and clean or replace if necessary 9. Install new oil pump

ENGINE 5.9L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none"> 1. Misaligned or deteriorated gaskets 2. Loose fastener, broken or porous metal part 3. Front or rear crankshaft oil seal leaking 4. Leaking oil gallery plug or cup plug 	<ol style="list-style-type: none"> 1. Replace gasket 2. Tighten, repair or replace the part 3. Replace seal 4. Remove and reseal threaded plug. Replace cup style plug
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	<ol style="list-style-type: none"> 1. CCV System malfunction 2. Defective valve stem seal(s) 3. Worn or broken piston rings 4. Scuffed pistons/cylinder walls 5. Carbon in oil control ring groove 6. Worn valve guides 7. Piston rings fitted too tightly in grooves 	<ol style="list-style-type: none"> 1. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS - DESCRIPTION) for correct operation 2. Repair or replace seal(s) 3. Hone cylinder bores. Install new rings 4. Hone cylinder bores and replace pistons as required 5. Remove rings and de-carbon piston 6. Inspect/replace valve guides as necessary 7. Remove rings and check ring end gap and side clearance. Replace if necessary

ENGINE 5.9L (Continued)

DIAGNOSIS AND TESTING—LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none"> 1. Gaskets and O-Rings. <ol style="list-style-type: none"> (a) Misaligned or damaged. (b) Loose fasteners, broken or porous metal parts. 2. Crankshaft rear seal 3. Crankshaft seal flange. Scratched, nicked or grooved. 4. Oil pan flange cracked. 5. Timing chain cover seal, damaged or misaligned. 6. Scratched or damaged vibration damper hub. 	<ol style="list-style-type: none"> 1. <ol style="list-style-type: none"> (a) Replace as necessary. (b) Tighten fasteners, Repair or replace metal parts. 2. Replace as necessary. 3. Polish or replace crankshaft. 4. Replace oil pan. 5. Replace seal. 6. Polish or replace damper.
OIL PRESSURE DROP	<ol style="list-style-type: none"> 1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pump suction tube loose or damaged. 	<ol style="list-style-type: none"> 1. Check and correct oil level. 2. Replace sending unit. 3. Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Clean or replace relief valve. 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> 1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals. 	<ol style="list-style-type: none"> 1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

ENGINE 5.9L (Continued)

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING—CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART below

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE 5.9L (Continued)

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

ENGINE 5.9L (Continued)

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60

strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 40° to 60° for proper seating of rings (Fig. 3).

8086fd41

Fig. 3 Cylinder Bore Crosshatch Pattern

1 - CROSSHATCH PATTERN

2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 40° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

REMOVAL

(1) Disconnect the battery negative cable.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Recover refrigerant from a/c system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(4) Remove the a/c condenser, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

ENGINE 5.9L (Continued)

(5) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

(6) Remove the washer bottle from the fan shroud.

(7) Remove the viscous fan/drive (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(8) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(9) Remove the upper crossmember and top core support.

(10) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(11) Remove the A/C compressor with the lines attached. Secure compressor out of the way.

(12) Remove generator assembly (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(13) Remove the air cleaner resonator and duct work as an assembly.

(14) Disconnect the throttle linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL).

(15) Remove throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(16) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(17) Remove the distributor cap and wiring.

(18) Disconnect the heater hoses.

(19) Disconnect the power steering hoses, if equipped.

(20) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(21) Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(22) On Manual Transmission vehicles, remove the shift lever (Refer to 21 - TRANSMISSION/TRAN-SAXLE/MANUAL/SHIFT COVER - REMOVAL).

(23) Raise and support the vehicle on a hoist and drain the engine oil.

(24) Remove engine front mount thru-bolt nuts.

(25) Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.

(26) Disconnect exhaust pipe at manifolds.

(27) Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(28) Remove the dust shield and transmission inspection cover.

(29) Remove drive plate to converter bolts (Automatic transmission equipped vehicles).

(30) Remove transmission bell housing to engine block bolts.

(31) Lower the vehicle.

(32) Install an engine lifting fixture.

(33) Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install engine lifting device.

(3) Lower engine into compartment and align engine with transmission:

- Manual Transmission: Align clutch disc assembly (if disturbed). Install transmission input shaft into clutch disc while mating engine and transmission surfaces. Install two transmission to engine block mounting bolts finger tight.

- Automatic Transmission: Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.

(4) Lower engine assembly until engine mount through bolts rest in mount perches.

(5) Install remaining transmission to engine block mounting bolts and tighten.

(6) Tighten engine mount through bolts.

(7) Install drive plate to torque converter bolts. (Automatic transmission models)

(8) Install the dust shield and transmission cover.

(9) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(10) Install exhaust pipe to manifold.

(11) Install the transmission cooler line brackets to the oil pan.

(12) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(13) Lower the vehicle.

(14) Remove engine lifting fixture.

(15) On Manual Transmission vehicles, install the shift lever (Refer to 21 - TRANSMISSION/TRAN-SAXLE/MANUAL/SHIFT COVER - INSTALLATION).

(16) Connect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Connect the power steering hoses, if equipped.

(18) Connect the heater hoses.

(19) Install the distributor cap and wiring.

(20) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

ENGINE 5.9L (Continued)

(21) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(22) Connect the throttle linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION).

(23) Install the air cleaner resonator and duct work..

(24) Install the generator and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(25) Install a/c compressor and lines (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(26) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(27) Install upper radiator support crossmember.

(28) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(29) Connect the radiator lower hose.

(30) Connect the transmission oil cooler lines to the radiator.

(31) Install the fan shroud.

(32) Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(33) Connect the radiator upper hose.

(34) Install the washer bottle.

(35) Install the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(36) Connect the transmission cooler lines.

(37) If equipped, install the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(38) Evacuate and charge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(39) Add engine oil to crankcase (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(40) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(41) Connect battery negative cable.

(42) Start engine and inspect for leaks.

(43) Road test vehicle.

CYLINDER HEAD

DESCRIPTION—CYLINDER HEAD

The cast iron cylinder heads (Fig. 4) are mounted to the cylinder block using ten bolts. The spark plugs are located in the peak of the wedge between the valves.

Fig. 4 Cylinder Head Assembly—V-8 Gas Engines

- 1 - EXHAUST VALVE
- 2 - SPARK PLUGS
- 3 - EXHAUST VALVES
- 4 - SPARK PLUGS
- 5 - EXHAUST VALVE
- 6 - INTAKE VALVES
- 7 - INTAKE VALVES

DESCRIPTION—CYLINDER HEAD COVER GASKET

The cylinder head cover gasket (Fig. 5) is a steel-backed silicone gasket, designed for long life usage.

Fig. 5 Cylinder Head Cover Gasket V-8 Gas Engines

- 1 - CYLINDER HEAD COVER GASKET

OPERATION—CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air

into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

OPERATION

The steel-backed silicone gasket is designed to seal the cylinder head cover for long periods of time through extensive heat and cold, without failure. The gasket is designed to be reusable.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

• Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

CYLINDER HEAD (Continued)

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the air cleaner resonator and duct work.
- (4) Remove the intake manifold-to-generator bracket support rod. Remove the generator.
- (5) Remove closed crankcase ventilation system.
- (6) Disconnect the evaporation control system.
- (7) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (8) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.
- (9) Remove distributor cap and wires.
- (10) Disconnect the coil wires.
- (11) Disconnect heat indicator sending unit wire.
- (12) Disconnect heater hoses and bypass hose.
- (13) Remove cylinder head covers and gaskets (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (14) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL) and throttle body as an assembly. Discard the flange side gaskets and the front and rear cross-over gaskets.
- (15) Remove exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
- (16) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.
- (17) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.
- (18) Remove spark plugs.

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. If out-of-flatness exceeds 0.00075mm/mm (0.0001in./in.) times the span length in any direction, either replace head or lightly machine the head surface.

FOR EXAMPLE:—A 305 mm (12 in.) span is 0.102 mm (0.004 in.) out-of-flat. The allowable out-of-flat is 305×0.00075 (12 x 0.00075) equals 0.23 mm (0.009 in.). This amount of out-of-flat is acceptable.

The cylinder head surface finish should be 1.78-3.00 microns (70-125 microinches).

Inspect push rods. Replace worn or bent rods.

INSTALLATION

- (1) Clean all surfaces of cylinder block and cylinder heads.
- (2) Clean cylinder block front and rear gasket surfaces using a suitable solvent.
- (3) Position new cylinder head gaskets onto the cylinder block.
- (4) Position cylinder heads onto head gaskets and cylinder block.
- (5) Starting at top center, tighten all cylinder head bolts, in sequence (Fig. 6).

Fig. 6 Cylinder Head Bolt Tightening Sequence

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is **NOT** at TDC. Contact between the valves and piston could occur.

(6) Install push rods and rocker arm assemblies in their original position. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(7) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION) and throttle body assembly.

(8) Install exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).

CYLINDER HEAD (Continued)

(9) If required, adjust spark plugs to specifications. Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(10) Install coil wire.

(11) Connect heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(15) Install the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(16) Install the generator and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque. Tighten the adjusting strap bolt to 23 N·m (200 in. lbs.) torque.

(17) Install the intake manifold-to-generator bracket support rod. Tighten the bolts.

(18) Place the cylinder head cover gaskets in position and install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(19) Install closed crankcase ventilation system.

(20) Connect the evaporation control system.

(21) Install the air cleaner.

(22) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(23) Connect the negative cable to the battery.

(24) Start engine check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

NOTE: A steel backed silicon gasket is used with the cylinder head cover (Fig. 7). This gasket can be used again.

J9209-105

Fig. 7 Cylinder Head Cover Gasket

1 - CYLINDER HEAD COVER GASKET

(1) Disconnect the negative cable from the battery.

(2) Disconnect the spark plug wires from the spark plugs and set aside.

(3) Disconnect closed ventilation system and evaporation control system from cylinder head cover.

(4) Remove cylinder head cover and gasket.

CLEANING

Clean cylinder head cover gasket surface.

Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.

Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

(1) The cylinder head cover gasket can be used again. Install the gasket onto the head rail.

(2) Position the cylinder head cover onto the gasket. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(3) Install closed crankcase ventilation system and evaporation control system.

(4) Connect the spark plug wires to the spark plugs.

(5) Connect the negative cable to the battery.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

Both the intake and exhaust valves are made of steel. The intake valve is 48.768 mm (1.92 inches) in diameter and the exhaust valve is 41.148 mm (1.62 inches) in diameter and has a 2.032 mm (0.080 inch) wafer interia welded to the tip for durability. These valves are not splayed.

STANDARD PROCEDURE—VALVES, GUIDES AND SPRINGS

VALVE CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

VALVE GUIDES

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 8). The special sleeve places the valve at the correct height for checking with a dial indicator.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 8 Positioning Valve with Tool C-3973**

- 1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 9).

**Fig. 9 Measuring Valve Guide Wear**

- 1 - VALVE
2 - SPECIAL TOOL C-3339

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

VALVE GUIDES

Service valves with oversize stems are available. Refer to REAMER SIZES CHART

REAMER SIZES CHART

REAMER O/S	VALVE GUIDE SIZE
0.076 mm (0.003 in.)	8.026 - 8.052 mm (0.316 - 0.317 in.)
0.381 mm (0.015 in.)	8.331 - 8.357 mm (0.328 - 0.329 in.)

(1) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 in.). Use a two step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a 43-1/4° to 43-3/4° face angle and a 44-1/4° to 44-3/4° seat angle (Fig. 10).

**Fig. 10 Valve Face and Seat Angles**

80ba7a5f

- 1 - CONTACT POINT
A,B,C and D Refer to VALVE FACE AND VALVE SEAT ANGLE CHART

VALVE FACE AND VALVE SEAT ANGLE CHART

ITEM	DESCRIPTION	SPECIFICATION
A	SEAT WIDTH INTAKE	1.016 - 1.524 mm (0.040 - 0.060 in.)
	EXHAUST	1.524 - 2.032 mm (0.060 - 0.080 in.)
B	FACE ANGLE (INT. AND EXT.)	43¼° - 43¾°
C	SEAT ANGLE (INT. AND EXT.)	44¼° - 44¾°
D	CONTACT SURFACE	—

INTAKE/EXHAUST VALVES & SEATS (Continued)

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 11). Valves with less than 1.190 mm (0.047 in.) margin should be discarded.

Fig. 11 Intake and Exhaust Valves

- 1 - MARGIN
- 2 - VALVE SPRING RETAINER LOCK GROOVE
- 3 - STEM
- 4 - FACE

VALVE SEATS

CAUTION: DO NOT un-shroud valves during valve seat refacing (Fig. 12).

Fig. 12 Refacing Valve Seats

- 1 - STONE
- 2 - PILOT
- 3 - VALVE SEAT
- 4 - SHROUD

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 in.) total indicator reading.

(3) Inspect the valve seat with Prussian blue, to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of intake seats should be 1.016-1.524 mm (0.040-0.060 in.). The width of the exhaust seats should be 1.524-2.032 mm (0.060-0.080 in.).

VALVE SPRINGS

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 in.. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 in. mark on the threaded stud. Be sure the zero mark is to the front (Fig. 13). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

REMOVAL

(1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Compress valve springs using Valve Spring Compressor Tool MD- 998772A and adapter 6716A.

(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

INTAKE/EXHAUST VALVES & SEATS (Continued)

Fig. 13 Testing Valve Spring for Compressed Length

- 1 - TORQUE WRENCH
2 - VALVE SPRING TESTER

INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 14). The special sleeve places the valve at the correct height for checking with a dial indicator.

Fig. 14 Positioning Valve with Tool C-3973

- 1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 15).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

Fig. 15 Measuring Valve Guide Wear

- 1 - VALVE
2 - SPECIAL TOOL C-3339

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Coat valve stems with lubrication oil and insert them in cylinder head.

(5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.

(6) Install new seals on all valve guides. Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. This should bring spring height back to normal 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

(8) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

ROCKER ARM / ADJUSTER ASSY

REMOVAL

(1) Remove cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove the rocker arm bolts and pivots (Fig. 16). Place them on a bench in the same order as removed.

(3) Remove the push rods and place them on a bench in the same order as removed.

Fig. 16 Rocker Arms

- 1 - ROCKER ARMS
2 - CYLINDER HEAD

INSTALLATION

(1) Rotate the crankshaft until the "V8" mark lines up with the TDC mark on the timing chain case cover. This mark is located 147° ATDC from the No.1 firing position.

(2) Install the push rods in the same order as removed.

(3) Install rocker arm and pivot assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(4) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ENGINE BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leakage.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper. Refer to Honing Cylinder Bores in the Service Procedures portion of this Section.

Inspect the oil line plug, the oil line plug is located in the vertical passage at the rear of the block between the oil-to-filter and oil-from-filter passages (Fig. 17). Improper installation or missing plug could cause erratic, low, or no oil pressure.

The oil plug must come out the bottom. Use flat dowel, down the oil pressure sending unit hole from the top, to remove oil plug.

(1) Remove oil pressure sending unit from back of block.

(2) Insert a 3.175 mm (1/8 in.) finish wire, or equivalent, into passage.

(3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 in.) from machined surface of block (Fig. 17). If plug is too high, use a suitable flat dowel to position properly.

Fig. 17 Oil Line Plug

- 1 - RIGHT OIL GALLERY
2 - CYLINDER BLOCK
3 - OIL FROM FILTER TO SYSTEM
4 - OIL TO FILTER
5 - FROM OIL PUMP
6 - CRANKSHAFT
7 - PLUG

(4) If plug is too low, remove oil pan and No. 4 main bearing cap. Use suitable flat dowel to position properly. Coat outside diameter of plug with Mopar®

ENGINE BLOCK (Continued)

Stud and Bearing Mount Adhesive. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 in.) from bottom of the block.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL—CAMSHAFT BEARINGS

NOTE: This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 18).

Fig. 18 Camshaft Bearings

- 1 - SPECIAL TOOL C-3132-A
2 - MAIN BEARING OIL HOLE

REMOVAL—CAMSHAFT

NOTE: The camshaft has an integral oil pump and distributor drive gear (Fig. 19).

Fig. 19 Camshaft and Sprocket Assembly

- 1 - THRUST PLATE
2 - OIL PUMP AND DISTRIBUTOR DRIVE GEAR INTEGRAL WITH CAMSHAFT
3 - CAMSHAFT SPROCKET

(1) Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(2) Remove the A/C Condenser (if equipped)

(3) Remove the engine cover.

(4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(5) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(6) Remove timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL) and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(7) Remove rocker arms.

(8) Remove push rods and tappets. Identify each part so it can be installed in its original location.

(9) Remove distributor and lift out the oil pump and distributor drive shaft.

(10) Remove camshaft thrust plate, note location of oil tab (Fig. 20).

Fig. 20 Timing Chain Oil

- 1 - THRUST PLATE FRONT SIDE
2 - CHAIN OIL TAB
3 - THRUST PLATE REAR SIDE

(11) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

INSTALLATION—CAMSHAFT BEARINGS

(1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.

(2) Position rear bearing in the tool. Install horse-shoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

INSTALLATION—CAMSHAFT

(1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft to within 51 mm (2 inches) of its final position in cylinder block.

(2) Install Camshaft Holder Tool C-3509 with tongue back of distributor drive gear (Fig. 21).

Fig. 21 Camshaft Holding Tool C-3509 (Installed Position)

- 1 - SPECIAL TOOL C-3509
- 2 - DRIVE GEAR
- 3 - DISTRIBUTOR LOCK BOLT

(3) Hold tool in position with a distributor lock-plate bolt. This tool will restrict camshaft from being pushed in too far and prevent knocking out the welch plug in rear of cylinder block. **Tool should remain installed until the camshaft and crankshaft sprockets and timing chain have been installed.**

(4) Install camshaft thrust plate and chain oil tab. **Make sure tang enters lower right hole in thrust plate.** Tighten bolts to 24 N·m (210 in. lbs.) torque. Top edge of tab should be flat against thrust plate in order to catch oil for chain lubrication.

(5) Install timing chain and gears (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Measure camshaft end play (Refer to 9 - ENGINE - SPECIFICATIONS). If not within limits install a new thrust plate.

(7) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

(8) Install distributor and distributor drive shaft.

(9) Install push rods and tappets.

(10) Install rocker arms.

(11) Install timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(14) Install the engine cover.

(15) Install the A/C Condenser (if equipped)

(16) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(17) Start engine check for leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE—CONNECTING ROD BEARING FITTING

Fit all rods on a bank until completed. **DO NOT** alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, be certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Bearings are available in 0.025 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 22) is of a cast nodular steel splayed type design, with five main bearing journals. The crankshaft is located at the bottom of the engine block and is held in place with five main bearing caps. The number 3 counterweight is the location for journal size identification.

Undersize Journal	Identification Stamp
0.025 mm (0.001 inch) (Rod)	R1-R2-R3 or R4
0.025 mm (0.001 inch) (Main)	M1-M2-M3-M4 or M5

Fig. 22 Crankshaft with Journal Size Identification

OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flywheel or flexplate.

REMOVAL

NOTE: This procedure can be done in vehicle. However the transmission must be removed first.

(1) If crankshaft is to be removed while engine is in vehicle remove the transmission. Refer to Group 21, for correct procedure.

(2) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove the oil pump from the rear main bearing cap (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(4) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(5) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(6) Identify rod bearing caps before removal. Remove rod bearing caps with bearings.

CAUTION: Support crankshaft before removing main bearing caps. failure to do so will allow the crankshaft to fall damaging the crankshaft.

(7) Using a suitable jack, support the crankshaft.

(8) Identify main bearing caps before removal. Remove main bearing caps and bearings one at a time.

(9) Lower the crankshaft out of the block.

(10) Remove and discard the crankshaft rear oil seals.

(11) Remove and discard the front crankshaft oil seal.

INSTALLATION

(1) Clean Gasket Maker residue and sealant from the cylinder block and rear cap mating surface. Do this before applying the Mopar® Gasket Maker and the installation of rear cap.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 23). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

J9509-75

Fig. 23 Sealant Application to Bearing Cap

1 - .25 DROP OF LOCTITE 515 ON BOTH SIDES OF REAR MAIN CAP

(8) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess

CRANKSHAFT (Continued)

material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(13) Position the connecting rods onto the crankshaft and install the rod bearing caps. Tighten the nuts to 61 N·m (45 ft. lbs.).

(14) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 24). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(15) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(16) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

Fig. 24 Apply Sealant to Bearing Cap to Block Joint

- 1 - MOPAR® GEN II SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP
- 2 - SEALANT APPLIED
- 3 - CYLINDER BLOCK
- 4 - REAR MAIN BEARING CAP

(17) If the transmission was removed, install the transmission.

CRANKSHAFT MAIN BEARINGS

DESCRIPTION

Main bearings (Fig. 25) are located in the cylinder block. One half of the main bearing is located in the crankshaft main bore the other half of the matching bearing is located in the main bearing cap. there are five main bearings. Number three main bearing is flanged, this flange controls crankshaft thrust.

Fig. 25 Main Bearing Orientation

OPERATION

The main bearings encircle the crankshaft main bearing journals, this aligns the crankshaft to the centerline of the engine and allows the crankshaft to turn without wobbling or shaking therefore eliminating vibration. The main bearings are available in standard and undersizes.

STANDARD PROCEDURE—CRANKSHAFT MAIN BEARING FITTING

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of No.2 and 4 are interchangeable.

Upper and lower No.3 bearing halves are flanged to carry the crankshaft thrust loads. They are NOT interchangeable with any other bearing halves in the engine (Fig. 26). Bearing shells are available in standard and the following undersizes: Never install an undersize bearing that will reduce clearance below specifications.

Main Bearing Undersize Availability List

- 0.25 mm (0.001 inch)
- 0.051 mm (0.002 inch)
- 0.076 mm (0.003 inch)

CRANKSHAFT MAIN BEARINGS (Continued)

- 0.254 mm (0.010 inch)
- 0.305 mm (0.012 inch)

Fig. 26 Main Bearing

REMOVAL

- (1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Remove the oil pump from the rear main bearing cap (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
- (3) Identify bearing caps before removal. Remove bearing caps one at a time.
- (4) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 27).
- (5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

- (1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 27).
- (2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.
- (3) Install the bearing caps. Clean and oil the bolts. Tighten the capbolts to 115 N·m (85 ft. lbs.) torque.
- (4) Install the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
- (5) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
- (6) Start engine check for leaks.

Fig. 27 Upper Main Bearing Removal and Installation with Tool C-3059

- 4 - BEARING

CRANKSHAFT OIL SEAL - FRONT**DESCRIPTION**

The crankshaft rear seal is a two piece viton seal. The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover. One part of the two piece rear seal is located in a slot in the number four (4) crankshaft main bore, the second part of the two piece seal is located in the number four (4) main bearing cap.

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

REMOVAL

The oil seal can be replaced without removing the timing chain cover, provided that the cover is not misaligned.

- (1) Disconnect the negative cable from the battery.
- (2) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (3) If front seal is suspected of leaking, check front oil seal alignment to crankshaft. The seal installation/alignment Tool 6635, should fit with minimum interference. If tool does not fit, the cover must be removed and installed properly.

CRANKSHAFT OIL SEAL - FRONT (Continued)

(4) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal bore of cover.

INSTALLATION

(1) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 28). Seat the oil seal in the groove of the tool.

(2) Position the seal and tool onto the crankshaft (Fig. 29).

(3) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 30).

(4) Remove the vibration damper bolt and seal installation tool.

(5) Inspect the seal flange on the vibration damper.

(6) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(7) Connect the negative cable to the battery.

J9309-44

Fig. 28 Placing Oil Seal on Installation Tool 6635

- 1 - CRANKSHAFT FRONT OIL SEAL
- 2 - INSTALL THIS END INTO SPECIAL TOOL 6635

CRANKSHAFT OIL SEAL - REAR

DESCRIPTION

The crankshaft rear seal is a two piece viton seal. The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover. One part of the two piece rear seal is located in a slot in the cylinder block oppsite the crankshaft main bearing cap, the second part of the two piece seal is located in the main bearing cap itself.

J9309-45

J9309-46

Fig. 30 Installing Oil Seal

- 1 - SPECIAL TOOL 6635
- 2 - TIMING CHAIN COVER

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

CRANKSHAFT OIL SEAL - REAR (Continued)

REMOVAL

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Remove the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL). Discard the old upper seal.

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap. Remove and discard the old lower oil seal.

(4) Carefully remove and discard the old upper oil seal.

LOWER SEAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap and discard the old lower seal.

INSTALLATION

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Clean the cylinder block rear cap mating surface. Be sure the seal groove is free of debris. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing toward the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main

bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

Fig. 31 Sealant Application to Bearing Cap

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT SLOTS
- 2 - MOPAR® GASKET MAKER (OR EQUIVALENT)
- 3 - CAP ALIGNMENT SLOT
- 4 - REAR MAIN BEARING CAP

(8) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(11) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing (Fig. 32). Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(12) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(13) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Clean the cylinder block mating surfaces before oil seal installation. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil. To allow ease of installation of the seal, loosen at least the two main bearing caps forward of the rear bearing cap.

CRANKSHAFT OIL SEAL - REAR (Continued)

Fig. 32 Apply Sealant to Bearing Cap-to-Block Joint

- 1 - MOPAR® GEN II SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP
- 2 - SEALANT APPLIED
- 3 - CYLINDER BLOCK
- 4 - REAR MAIN BEARING CAP

(3) Rotate the new upper seal into the cylinder block, being careful not to shave or cut the outer surface of the seal. To ensure proper installation, use the installation tool provided with the kit. Install the new seal with the white paint facing toward the rear of the engine.

(4) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing toward the rear of the engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application. Be sure the white paint faces toward the rear of the engine.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten ALL cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap-to-block and oil pan sealing (Fig. 32). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

LOWER SEAL

(1) Clean the rear main cap mating surfaces including the oil pan gasket groove.

(2) Carefully install a new upper seal. Refer to UPPER SEAL—CRANKSHAFT INSTALLED.

(3) Lightly oil the new lower seal lips with engine oil.

(4) Install a new lower seal in bearing cap with the white paint facing the rear of engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten the cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing. Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

DISTRIBUTOR BUSHING

REMOVAL

(1) Remove distributor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/DISTRIBUTOR - REMOVAL).

(2) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(3) Insert Distributor Drive Shaft Bushing Puller Tool C-3052 into old bushing and thread down until a tight fit is obtained (Fig. 33).

(4) Hold puller screw and tighten puller nut until bushing is removed.

INSTALLATION

(1) Slide new bushing over burnishing end of Distributor Drive Shaft Bushing Driver/Burnisher Tool C-3053. Insert the tool and bushing into the bore.

(2) Drive bushing and tool into position, using a hammer (Fig. 34).

(3) As the burnisher is pulled through the bushing, the bushing is expanded tight in the block and bur-

DISTRIBUTOR BUSHING (Continued)

2 - BUSHING

nished to correct size (Fig. 35). **DO NOT ream this bushing.**

CAUTION: This procedure **MUST** be followed when installing a new bushing or seizure to shaft may occur.

**Fig. 35 Burnishing Distributor Driveshaft Bushing**

- 1 - SPECIAL TOOL C-3053
2 - BUSHING

(4) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(5) Install the distributor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/DISTRIBUTOR - INSTALLATION).

HYDRAULIC LIFTERS

DIAGNOSIS AND TESTING—HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.

(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

HYDRAULIC LIFTERS (Continued)

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

LEAK-DOWN TEST

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 36).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Universal Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require

20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

Fig. 36 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

REMOVAL

(1) Remove the air cleaner assembly and air in-let hose.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove rocker assembly and push rods. Identify push rods to ensure installation in original locations.

(4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(5) Remove yoke retainer and aligning yokes.

(6) Slide Hydraulic Tappet Remover/Installer Tool C-4129-A through opening in cylinder head and seat tool firmly in the head of tappet.

(7) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(8) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSTALLATION

(1) Lubricate tappets.

HYDRAULIC LIFTERS (Continued)

(2) Install tappets and push rods in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).

(3) Install aligning yokes with ARROW toward camshaft.

(4) Install yoke retainer. Tighten the bolts to 23 N·m (200 in. lbs.) torque. Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(5) Install push rods in original positions.

(6) Install rocker arms.

(7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(8) Install air cleaner assembly and air in-let hose.

(9) Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of aluminum and have three ring grooves, the top two grooves are for the compression rings and the bottom groove is for the oil control ring. The connecting rods are forged steel and are coined prior to heat treat. The piston pins are press fit.

80ba7a6c

Fig. 37 Piston Measurements

1 - 49.53 mm (1.95 IN.)

STANDARD PROCEDURE—PISTON FITTING

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch) at 21°C (70°F).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 37).

PISTON & CONNECTING ROD (Continued)

REMOVAL

(1) Remove the engine from the vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.

(5) Be sure each connecting rod and connecting rod cap is identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing the assemblies from the engine, rotate crankshaft so that the connecting rod is centered in cylinder bore and at BDC. **Be careful not to nick crankshaft journals.**

(7) After removal, install bearing cap on the mating rod.

CLEANING

Clean the piston and connecting rod assembly using a suitable solvent.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(2) Before installing the ring compressor, be sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 38).

(3) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385). **Be sure position of rings does not change during this operation.**

(4) Install connecting rod bolt protectors on rod bolts. The long protector should be installed on the numbered side of the connecting rod.

J9309-80

Fig. 38 Proper Ring Installation

1 - OIL RING SPACER GAP

2 - SECOND COMPRESSION RING GAP OIL RING RAIL GAP (TOP)

3 - OIL RING RAIL GAP (BOTTOM)

4 - TOP COMPRESSION RING GAP

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on crankshaft journal.

(7) The notch, or groove, on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(8) Install rod caps. Be sure connecting rod, connecting rod cap, and cylinder bore number are the same. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(9) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(10) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(11) Install the engine into the vehicle (Refer to 9 - ENGINE - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE—PISTON RING FITTING

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 in. from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

PISTON RINGS (Continued)

(b) Insert feeler gauge in the gap. The top compression ring gap should be between 0.254-0.508 mm (0.010-0.020 in.). The second compression ring gap should be between 0.508-0.762 mm (0.020-0.030 in.). The oil ring gap should be 0.254-1.270 mm (0.010-0.050 in.).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Rings with excess gaps should not be used.

(2) Install rings, and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter "O", an oval depression, or the word "TOP" (Fig. 39) (Fig. 41).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 40) (Fig. 41). An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word "TOP" facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 in.) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 in.) side clearance.

(e) Pistons with insufficient, or excessive, side clearance should be replaced.

J9009-46

Fig. 39 Second Compression Ring Identification (Typical)

- 1 - SECOND COMPRESSION RING (BLACK CAST IRON)
- 2 - CHAMFER
- 3 - TWO DOTS

(3) Orient the rings:

(a) Arrange top compression ring 90° counter-clockwise from the oil ring rail gap (Fig. 42).

(b) Arrange second compression ring 90° clockwise from the oil ring rail gap (Fig. 42).

VIBRATION DAMPER

REMOVAL

(1) Disconnect the battery negative cable.

(2) Remove the cooling system fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

(3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove vibration damper bolt and washer from end of crankshaft.

(5) Position Special Tool 8513 Insert into the crankshaft nose.

VIBRATION DAMPER (Continued)

- 2 - SPECIAL TOOL 1026

(7) Pull vibration damper off of the crankshaft.

INSTALLATION

CAUTION: Thoroughly remove any contaminants from the crankshaft nose and the vibration damper bore. Failure to do so can cause sever damage to the crankshaft.

- (1) Position the vibration damper onto the crankshaft.
- (2) Place installing tool, part of Puller Tool Set C-3688 in position and press the vibration damper onto the crankshaft (Fig. 44).

80c0722e

Fig. 44 Vibration Damper Installation

1 - SPECIAL TOOL C-3688

(3) Install the crankshaft bolt and washer. Tighten the bolt to 244 N·m (180 ft. lbs.) torque.

(4) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(5) Position the fan shroud and install the bolts. Tighten the retainer bolts to 11 N·m (95 in. lbs.) torque.

(6) Install the cooling fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(7) Connect the battery negative cable.

FRONT MOUNT**REMOVAL**

- (1) Disconnect the battery negative cable.
- (2) Position fan to ensure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

- (3) Install engine support/lifting fixture.
- (4) Raise vehicle on hoist.
- (5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 45).
- (6) Remove engine support bracket/cushion bolts (Fig. 45). Remove the support bracket/cushion and heat shields.

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the through-bolt into the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and through-bolt into support cushion brackets (Fig. 46).

FRONT MOUNT (Continued)

(5) Lower the vehicle.

(6) Remove lifting fixture.

**Fig. 46 Positioning Engine Front Mounts**

J9409-54

- 1 - ENGINE SUPPORT BRACKET/CUSHION
- 2 - SUPPORT CUSHION BRACKET

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 47).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

**Fig. 47 Engine Rear Support Cushion Assemblies**

J9509-126

REAR MOUNT (Continued)

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 88 N·m (65 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 41 N·m (30 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 49).

(4) Install the support cushion bolts and tighten to 41 N·m (30 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

LUBRICATION

DESCRIPTION

A gear-type positive displacement pump (Fig. 48) is mounted at the underside of the rear main bearing cap. The pump uses a pick-up tube and screen assembly to gather engine oil from the oil pan.

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery, which extends the entire length on the right side of the block. The oil then goes down to the No. 1 main bearing, back up to the left side of the block, and into the oil gallery on the left side of the engine.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil

Fig. 48 Positive Displacement Oil Pump—Typical

- 8 - LARGE CHAMFERED EDGE
- 9 - BOLT
- 10 - COVER
- 11 - OUTER ROTOR

passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the No. 1 main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets, which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide holes and the oil drain-back passages in the cylinder head, past the valve tappet area, and then returns to the oil pan (Fig. 49).

LUBRICATION (Continued)

DIAGNOSIS AND TESTING—ENGINE OIL LEAKS

Begin with a through visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil-soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to be sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light source.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat previous step.

(5) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method as follows:

(6) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(7) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(8) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(9) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(10) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(11) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose. Proceed to next step.

(12) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL**STANDARD PROCEDURE—ENGINE OIL****OIL LEVEL INDICATOR (DIPSTICK)**

The engine oil level indicator is located at the right front of the engine, left of the generator on 3.9L engines (Fig. 50).

Fig. 50 Oil Level Indicator Location

- 1 - CYLINDER HEAD COVER
- 2 - ENGINE OIL FILL CAP
- 3 - DIPSTICK
- 4 - ENGINE OIL FILTER
- 5 - FILTER BOSS

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

(1) Position vehicle on level surface.

(2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.

(3) Wipe dipstick clean.

(4) Install dipstick and verify it is seated in the tube.

OIL (Continued)

(5) Remove dipstick, with handle held above the tip, take oil level reading.

(6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. This information can be found in the owner's manual.

TO CHANGE ENGINE OIL

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Hoist vehicle.

(3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(6) Install drain plug in crankcase.

(7) Change oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(9) Install oil fill cap.

(10) Start engine and inspect for leaks.

(11) Stop engine and inspect oil level.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 51).

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 54) of oil and grime.

(6) Install new filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

Fig. 51 Oil Filter Removal—Typical

1 - ENGINE OIL FILTER

2 - OIL FILTER WRENCH

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 52) hand tighten filter one full turn, do not over tighten.

(3) Add oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

Fig. 52 Oil Filter Sealing Surface—Typical

1 - SEALING SURFACE

2 - RUBBER GASKET

3 - OIL FILTER

OIL PAN

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove engine oil dipstick.

(3) Raise vehicle.

(4) Drain engine oil.

(5) Remove exhaust pipe.

(6) Remove left engine to transmission strut.

(7) Loosen the right side engine support bracket cushion thru-bolt nut and raise the engine slightly. Remove oil pan by sliding backward and out.

(8) Remove the one-piece gasket.

OIL PAN (Continued)

CLEANING

Clean the block and pan gasket surfaces.

Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

(3) If present, trim excess sealant from inside the engine.

(4) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 53).

Fig. 53 Fabrication of Alignment Dowels

- 1 - 5/16" X 1 1/2" BOLT
- 2 - DOWEL
- 3 - SLOT

(5) Install the dowels in the cylinder block (Fig. 54).

(6) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent in the corner of the cap and the cylinder block.

(7) Slide the one-piece gasket over the dowels and onto the block.

(8) Position the oil pan over the dowels and onto the gasket.

Fig. 54 Position of Dowels in Cylinder Block

- 1 - DOWEL
- 2 - DOWEL
- 3 - DOWEL
- 4 - DOWEL

(9) Install the oil pan bolts. Tighten the bolts to 24 N·m (215 in. lbs.) torque.

(10) Remove the dowels. Install the remaining oil pan bolts. Tighten these bolts to 24 N·m (215 in. lbs.) torque.

(11) Lower the engine into the support cushion brackets and tighten the thru bolt nut to the proper torque.

(12) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.

(13) Install the engine to transmission strut.

(14) Install exhaust pipe.

(15) Lower vehicle.

(16) Install dipstick.

(17) Connect the negative cable to the battery.

(18) Fill crankcase with oil to proper level.

OIL PUMP

REMOVAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump from rear main bearing cap.

OIL PUMP (Continued)

DISASSEMBLE

(1) Remove the relief valve as follows:

(a) Remove cotter pin. Drill a 3.175 mm (1/8 inch) hole into the relief valve retainer cap and insert a self-threading sheet metal screw.

(b) Clamp screw into a vise and while supporting oil pump, remove cap by tapping pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 55).

RH174

Fig. 55 Oil Pressure Relief Valve

- 1 - OIL PUMP ASSEMBLY
- 2 - COTTER PIN
- 3 - RELIEF VALVE
- 4 - RETAINER CAP
- 5 - SPRING

- (2) Remove oil pump cover (Fig. 56).
- (3) Remove pump outer rotor and inner rotor with shaft (Fig. 56).
- (4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump assembly if cover is scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 57). If a 0.038 mm (0.0015 inch) feeler gauge can be inserted between cover and straightedge, pump assembly should be replaced.

RY10B

Fig. 57 Checking Oil Pump Cover Flatness

- 1 - COVER
- 2 - STRAIGHT EDGE
- 3 - FEELER GAUGE

OIL PUMP (Continued)

Measure thickness and diameter of OUTER rotor. If outer rotor thickness measures 20.9 mm (0.825 inch) or less or if the diameter is 62.7 mm (2.469 inches) or less, replace outer rotor (Fig. 58).

RH176

Fig. 58 Measuring Outer Rotor Thickness

If inner rotor measures 20.9 mm (0.825 inch) or less, replace inner rotor and shaft assembly (Fig. 59).

RH177

Fig. 59 Measuring Inner Rotor Thickness

Slide outer rotor into pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 60). If clearance is 0.356 mm (0.014 inch) or more, replace oil pump assembly.

Install inner rotor and shaft into pump body. If clearance between inner and outer rotors is 0.203 mm (0.008 inch) or more, replace shaft and both rotors (Fig. 61).

Place a straightedge across the face of the pump, between bolt holes. If a feeler gauge of 0.102 mm (0.004 inch) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 62).

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

8020cd6f

OIL PUMP (Continued)

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications (Fig. 63).

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

RN98

Fig. 63 Proper Installation of Retainer Cap

- 1 - RETAINER CAP
- 2 - CHAMFER
- 3 - COTTER KEY

ASSEMBLE

- (1) Install pump rotors and shaft, using new parts as required.
- (2) Position the oil pump cover onto the pump body. Tighten cover bolts to 11 N·m (95 in. lbs.) torque.
- (3) Install the relief valve and spring. Insert the cotter pin.
- (4) Tap on a new retainer cap.
- (5) Prime oil pump before installation by filling rotor cavity with engine oil.

INSTALLATION

- (1) Install oil pump. During installation slowly rotate pump body to ensure driveshaft-to-pump rotor shaft engagement.
- (2) Hold the oil pump base flush against mating surface on No.5 main bearing cap. Finger tighten pump attaching bolts. Tighten attaching bolts to 41 N·m (30 ft. lbs.) torque.
- (3) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD

DESCRIPTION

The aluminum intake manifold (Fig. 64) is a single plane design with equal length runners and uses a

separate plenum, therefore the manifold does have a plenum gasket. It also uses separate flange gaskets and front and rear cross-over gaskets. Extreme care must be used when sealing the gaskets to ensure that excess sealant does not enter the intake runners causing a restriction. Whenever the intake manifold is removed inspect the plenum pan for evidence of excess oil buildup, this condition indicates that the plenum pan gasket is leaking.

80c071af

Fig. 64 Intake Manifold and Throttle Body—V-8 Gas Engines Typical

- 1 - FUEL RAIL ASSEMBLY
- 2 - FUEL RAIL MOUNTING BOLTS
- 3 - FUEL RAIL CONNECTING HOSES

OPERATION

The intake manifold, meters and delivers air to the combustion chambers allowing the fuel delivered by the fuel injectors to ignite, thus producing power.

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS, OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.

INTAKE MANIFOLD (Continued)

(3) If a change in RPMs occurs, the area of the suspected leak has been found.

(4) Repair as required.

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

(4) Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(5) Remove the accessory drive bracket.

(6) Remove the air cleaner.

(7) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(8) Disconnect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL) and if so equipped, the speed control and transmission kickdown cables.

(9) Remove the return spring.

(10) Remove the distributor cap and wires.

(11) Disconnect the coil wires.

(12) Disconnect the heat indicator sending unit wire.

(13) Disconnect the heater hoses and bypass hose.

(14) Remove the closed crankcase ventilation and evaporation control systems.

(15) Remove intake manifold bolts.

(16) Lift the intake manifold and throttle body out of the engine compartment as an assembly.

(17) Remove and discard the flange side gaskets and the front and rear end seals.

(18) Remove the throttle body bolts and lift the throttle body off the intake manifold (Fig. 65). Discard the gasket.

(19) If required, remove the plenum pan and gasket. Discard gasket.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

80c071af

Fig. 65 Throttle Body Assembly

1 - FUEL RAIL ASSEMBLY

2 - FUEL RAIL MOUNTING BOLTS

3 - FUEL RAIL CONNECTING HOSES

INSTALLATION

(1) If removed, position new plenum gasket and install plenum pan (Fig. 66).

(2) Tighten plenum pan mounting bolts as follows:

- Step 1. Tighten bolts to 5.4 N·m (48 in. lbs.)
- Step 2. Tighten bolts to 9.5 N·m (84 in. lbs.)
- Step 3. Check all bolts are at 9.5 N·m (84 in. lbs.)

80c071eb

Fig. 66 Plenum Pan Bolt Tightening Sequence

INTAKE MANIFOLD (Continued)

(3) Install the flange gaskets. Ensure that the vertical port alignment tab is resting on the deck face of the block. Also the horizontal alignment tabs must be in position with the mating cylinder head gasket tabs (Fig. 68). The words MANIFOLD SIDE should be visible on the center of each flange gasket.

(4) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, to the four corner joints. An excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket. The sealant should be approximately 5 mm (0.2 in) in diameter and 15mm (0.6 in.) long.

(5) Install the front and rear end seals (Fig. 67). Make sure the molded dowel pins on the end seals fully enter the corresponding holes in the cylinder block.

(6) Carefully lower intake manifold into position on the cylinder block and cylinder heads. After intake manifold is in place, inspect to make sure seals are in place.

(7) Using a new gasket, install the throttle body onto the intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

80c071ae

Fig. 68 Intake Manifold Flange Gasket Alignment

- 2 - ALIGNMENT TABS
- 3 - CYLINDER HEAD GASKET

80c071ad

Fig. 67 Front and Rear End Seals

- 1 - FRONT END SEAL
- 2 - REAR END SEAL

(8) Install the intake manifold bolts and tighten as follows (Fig. 69):

- Step 1. Tighten bolts 1 through 4 to 8 N·m (72 in. lbs.) Tighten in alternating steps 1.4 N·m (12 in. lbs.) at a time

J9209-60

Fig. 69 Intake Manifold Bolt Tightening Sequence

- Step 2. Tighten bolts 5 through 12 to 8 N·m (72 in. lbs.)
- Step 3. Check all bolts are torqued to 8 N·m (72 in. lbs.)
- Step 4. Tighten all bolts in sequence to 16 N·m (12 ft. lbs.)
- Step 5. Check all bolts are torqued to 16 N·m (12 ft. lbs.)

INTAKE MANIFOLD (Continued)

(9) Install closed crankcase ventilation and evaporation control systems.

(10) Connect the coil wires.

(11) Connect the heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Hook up the return spring.

(15) Connect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION) and if so equipped, the speed control and transmission kick-down cables.

(16) Install the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Install the accessory drive bracket and A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(18) Install the generator and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque.

(19) Install the air cleaner.

(20) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Connect the negative cable to the battery.

J9311-11

Fig. 70 Exhaust Manifolds—V-8 Gas Engines Typical

- 1 - EXHAUST MANIFOLD (LEFT)
- 2 - BOLTS & WASHERS
- 3 - NUTS & WASHERS
- 4 - EXHAUST MANIFOLD (RIGHT)
- 5 - BOLTS & WASHERS

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds (Fig. 70) are constructed of cast iron and are LOG type with balanced flow. One exhaust manifold is attached to each cylinder head.

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise and support the vehicle.
- (3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
- (4) Lower the vehicle.
- (5) Remove the exhaust heat shields.
- (6) Remove bolts, nuts and washers attaching manifold to cylinder head.
- (7) Remove manifold from the cylinder head.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

(1) Position the engine exhaust manifolds on the two studs located on the cylinder head. Install conical washers and nuts on these studs (Fig. 71).

(2) Install two bolts and conical washers at the inner ends of the engine exhaust manifold outboard arms. Install two bolts WITHOUT washers on the center arm of engine exhaust manifold (Fig. 71). Starting at the center arm and working outward, tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(3) Install the exhaust heat shields.

(4) Raise and support the vehicle.

(5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

EXHAUST MANIFOLD (Continued)

- (6) Lower the vehicle.
- (7) Connect the negative cable to the battery.

TIMING BELT / CHAIN COVER(S)

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Remove water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).
- (3) Remove power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).
- (4) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (5) Loosen oil pan bolts and remove the front bolt at each side.
- (6) Remove the cover bolts.
- (7) Remove chain case cover and gasket using extreme caution to avoid damaging oil pan gasket.

INSTALLATION

- (1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.
- (2) The water pump mounting surface must be cleaned.
- (3) Using a new cover gasket, carefully install chain case cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

NOTE: Special Tool 6635 must be used to align the front cover and seal with the crankshaft.

- (4) Position the special tool 6635 onto the crankshaft (Fig. 72).

Fig. 72 Position Special Tool 6635 onto Crankshaft

- 1 - SPECIAL TOOL 6635
- 2 - OIL SEAL
- 3 - TIMING CHAIN COVER

- (5) Tighten chain case cover bolts to 41 N·m (30 ft.lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

- (6) Remove special tool 6635.

- (7) Inspect the seal flange on the vibration damper.

- (8) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

- (9) Install water pump and housing assembly using new gaskets (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

- (10) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

- (11) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

- (12) Install the cooling system fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

- (13) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

- (14) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

- (15) Connect the negative cable to the battery.

- (16) Start engine check for leaks.

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Remove Timing Chain Cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- (3) Re-install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align timing marks as shown in (Fig. 73).
- (4) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

Fig. 73 Alignment of Timing Marks

1 - TIMING MARKS

INSPECTION—MEASURING TIMING CHAIN STRETCH

- (1) Place a scale next to the timing chain so that any movement of the chain may be measured.
- (2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.
- (3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 74).
- (4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

Fig. 74 Measuring Timing Chain Stretch

1 - TORQUE WRENCH
2 - 3.175 MM (0.125 IN.)

INSTALLATION

- (1) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.
- (2) Place timing chain around both sprockets.
- (3) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.
- (4) Lift sprockets and chain (keep sprockets tight against the chain in position as described).
- (5) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 75).

Fig. 75 Alignment of Timing Marks

1 - TIMING MARKS

- (6) Install the camshaft bolt. Tighten the bolt to 68 N·m (50 ft. lbs.) torque.
- (7) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.
- (8) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

ENGINE 8.0L**DESCRIPTION**

The 8.0 Liter (488 CID) ten-cylinder engine is a V-Type lightweight, single cam, overhead valve

Fig. 1 Firing Order

J948D-12

engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

Engine lubrication system consists of a gerotor type oil pump mounted in the timing chain cover and driven by the crankshaft. The V-10 uses a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7, 9 on the left bank and 2, 4, 6, 8, 10 on the right bank. The firing order is 1-10-9-4-3-6-5-8-7-2 (Fig. 1).

The engine serial number is located on the lower left front of the cylinder block in front of the engine mount (Fig. 2). When component part replacement is necessary, use the engine type and serial number for reference.

DIAGNOSIS AND TESTING—ENGINE**DIAGNOSIS - INTRODUCTION**

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to 14 - FUEL SYSTEM for fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

DIAGNOSIS AND TESTING—PERFORMANCE*PERFORMANCE DIAGNOSIS CHART—GASOLINE ENGINES*

(Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG CABLE - REMOVAL) 3. Clean fuel system 4. Install new valves 5. Test and replace as necessary (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL)

DIAGNOSIS AND TESTING— MECHANICAL

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase 2. Thin or diluted oil 3. Low oil pressure 4. Dirt in tappets/lash adjusters 5. Bent push rod(s) 6. Worn rocker arms 7. Worn tappets/lash adjusters 8. Worn valve guides 9. Excessive runout of valve seats or valve faces	1. Check for correct oil level. Adjust oil level by draining or adding as needed 2. Change oil. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) 3. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) for engine oil pressure test/specifications 4. Clean/replace hydraulic tappets/lash adjusters 5. Install new push rods 6. Inspect oil supply to rocker arms and replace worn arms as needed 7. Install new hydraulic tappets/lash adjusters 8. Inspect all valve guides and replace as necessary 9. Grind valves and seats

ENGINE 8.0L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
CONNECTING ROD NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive connecting rod bearing clearance 5. Connecting rod journal out of round 6. Misaligned connecting rods 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) engine oil pressure test/specifications 3. Change oil to correct viscosity. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) for correct procedure/engine oil specifications Measure bearings for correct clearance with plasti-gage. Repair as necessary 5. Replace crankshaft or grind journals 6. Replace bent connecting rods
MAIN BEARING NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive main bearing clearance 5. Excessive end play 6. Crankshaft main journal out of round or worn 7. Loose flywheel or torque converter 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) 3. Change oil to correct viscosity. 4. Measure bearings for correct clearance. Repair as necessary 5. Check crankshaft thrust bearing for excessive wear on flanges 6. Grind journals or replace crankshaft 7. Inspect crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque
LOW OIL PRESSURE	<ol style="list-style-type: none"> 1. Low oil level 2. Faulty oil pressure sending unit 3. Clogged oil filter 4. Worn oil pump 5. Thin or diluted oil 6. Excessive bearing clearance 7. Oil pump relief valve stuck 8. Oil pump suction tube loose, broken, bent or clogged 9. Oil pump cover warped or cracked 	<ol style="list-style-type: none"> 1. Check oil level and fill if necessary 2. Install new sending unit 3. Install new oil filter 4. Replace oil pump assembly. 5. Change oil to correct viscosity. 6. Measure bearings for correct clearance 7. Remove valve to inspect, clean and reinstall 8. Inspect suction tube and clean or replace if necessary 9. Install new oil pump

ENGINE 8.0L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none"> 1. Misaligned or deteriorated gaskets 2. Loose fastener, broken or porous metal part 3. Front or rear crankshaft oil seal leaking 4. Leaking oil gallery plug or cup plug 	<ol style="list-style-type: none"> 1. Replace gasket 2. Tighten, repair or replace the part 3. Replace seal 4. Remove and reseal threaded plug. Replace cup style plug
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	<ol style="list-style-type: none"> 1. CCV System malfunction 2. Defective valve stem seal(s) 3. Worn or broken piston rings 4. Scuffed pistons/cylinder walls 5. Carbon in oil control ring groove 6. Worn valve guides 7. Piston rings fitted too tightly in grooves 	<ol style="list-style-type: none"> 1. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS - DESCRIPTION) for correct operation 2. Repair or replace seal(s) 3. Hone cylinder bores. Install new rings 4. Hone cylinder bores and replace pistons as required 5. Remove rings and de-carbon piston 6. Inspect/replace valve guides as necessary 7. Remove rings and check ring end gap and side clearance. Replace if necessary

ENGINE 8.0L (Continued)

DIAGNOSIS AND TESTING—LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none"> 1. Gaskets and O-Rings. <ol style="list-style-type: none"> (a) Misaligned or damaged. (b) Loose fasteners, broken or porous metal parts. 2. Crankshaft rear seal 3. Crankshaft seal flange. Scratched, nicked or grooved. 4. Oil pan flange cracked. 5. Timing chain cover seal, damaged or misaligned. 6. Scratched or damaged vibration damper hub. 	<ol style="list-style-type: none"> 1. <ol style="list-style-type: none"> (a) Replace as necessary. (b) Tighten fasteners, Repair or replace metal parts. 2. Replace as necessary. 3. Polish or replace crankshaft. 4. Replace oil pan. 5. Replace seal. 6. Polish or replace damper.
OIL PRESSURE DROP	<ol style="list-style-type: none"> 1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pump suction tube loose or damaged. 	<ol style="list-style-type: none"> 1. Check and correct oil level. 2. Replace sending unit. 3. Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Clean or replace relief valve. 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> 1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals. 	<ol style="list-style-type: none"> 1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

ENGINE 8.0L (Continued)

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING—CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART below

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE 8.0L (Continued)

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 3).

Fig. 3 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

ENGINE 8.0L (Continued)

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

REMOVAL

(1) Remove the battery.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Discharge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(4) Remove the upper crossmember.

(5) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

ENGINE 8.0L (Continued)

(6) Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove the A/C compressor with the lines attached (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL). Set aside.

(8) If equipped, remove the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

(9) Remove the washer fluid reservoir bottle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - REMOVAL AND INSTALLATION).

(10) Disconnect the top radiator hose.

(11) Remove the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(12) Remove the fan shroud.

(13) Disconnect the lower radiator hose.

(14) Disconnect the transmission cooler lines.

(15) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(16) Remove the generator with the wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(17) Remove the air cleaner.

(18) Disconnect the throttle linkage.

(19) Remove throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(20) Remove the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(21) Remove the coil assemblies with the ignition cables.

(22) Disconnect the heater hoses.

(23) Disconnect the power steering hoses, if equipped.

(24) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(25) On Manual Transmission vehicles, remove the shift lever.

(26) Raise and support the vehicle on a hoist.

(27) Remove the drain plug and drain the engine oil.

(28) Loosen front engine mount thru-bolt nuts.

(29) Remove the transmission cooler line brackets from oil pan.

(30) Disconnect exhaust pipe at manifold.

(31) Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(32) Remove transmission.

(33) Lower vehicle.

CAUTION: DO NOT lift the engine by the intake manifold.

(34) Install an engine lifting fixture.

(35) Remove engine from vehicle and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install an engine support fixture.

(3) Raise and support the vehicle on a hoist.

(4) Install Transmission.

(5) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(6) Install exhaust pipe to manifold.

(7) Install the transmission cooler line brackets from oil pan.

(8) Tighten the Front mount thru-bolts and nuts to 102N·m (75 ft. lbs.).

(9) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(10) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(11) Lower the vehicle.

(12) Remove engine lifting fixture.

(13) On Manual Transmission vehicles, install the shift lever.

(14) Connect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(15) Connect the heater hoses.

(16) Install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(17) Install the coil assemblies with the ignition cables.

(18) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(19) Connect the throttle linkage.

(20) Install the air cleaner box.

(21) Install the generator and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(22) Install the upper crossmember.

(23) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(24) Connect the lower radiator hose.

ENGINE 8.0L (Continued)

(25) Install the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(26) Connect the transmission cooler lines.

(27) Connect the power steering hoses, if equipped.

(28) Install the fan shroud.

(29) Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(30) Connect the top radiator hose.

(31) Install the washer fluid reservoir bottle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSTALLATION).

(32) If equipped, install the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(33) Install the A/C compressor with the lines attached (Refer to 24 - HEATING & AIR CONDI-

TIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(34) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(35) Evacuate (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) and charge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(36) Add coolant to the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(37) Install the battery.

(38) Warm engine and adjust as required.

(39) Road test vehicle.

ENGINE 8.0L (Continued)

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to 0, Lubrication and Maintenance.

A small amount of engine oil wetting the inside of the air cleaner housing is normal. When servicing, wipe out oil from air cleaner housing.

(1) Loosen clamp (Fig. 4) and remove air inlet tube (Fig. 5) at front of air cleaner housing cover.

(2) The air cleaner housing and air cleaner element cover are equipped with spring clips to seal cover to housing (Fig. 5). Unlatch clips from air cleaner cover and remove cover from air cleaner housing.

(3) Remove air cleaner element from air cleaner cover.

(4) Before installing a new air cleaner element, clean inside of air cleaner housing.

(5) If housing removal is necessary, disconnect crankcase vent hose and remove 4 housing-to-throttle body nuts.

CYLINDER HEAD

DESCRIPTION

The alloy cast iron cylinder heads (Fig. 7) are held in place by 12 bolts. The spark plugs are located in the peak of the wedge between the valves.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

• Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

CYLINDER HEAD (Continued)

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the heat shields (Fig. 8).

Fig. 8 Spark Plug Wire Heat Shields (Left Side Shown)

- 1 - EXHAUST MANIFOLD
- 2 - HEAT SHIELD

- (4) Remove the intake manifold-to-generator bracket support rod. Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

- (5) Remove closed crankcase ventilation system.
- (6) Disconnect the evaporation control system.
- (7) Remove the air cleaner.
- (8) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIV-

ERY - STANDARD PROCEDURE). Disconnect the fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

- (9) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

- (10) Remove coil pack and bracket (Fig. 9).

Fig. 9 Coil Pack and Bracket

- 1 - COIL PACKS AND BRACKET
- 2 - MOUNTING BOLTS (4)

- (11) Disconnect the coil wires.
- (12) Disconnect heat indicator sending unit wire.
- (13) Disconnect heater hoses and bypass hose.
- (14) Remove upper intake manifold and throttle body as an assembly (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- (15) Remove cylinder head covers and gaskets (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (16) Remove the EGR tube. Discard the gasket, for right side only.
- (17) Remove lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL). Discard the flange side gaskets and the front and rear cross-over gaskets.
- (18) Disconnect exhaust pipe from exhaust manifold.
- (19) Remove exhaust manifolds and gaskets (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
- (20) Remove rocker arm assemblies and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER

CYLINDER HEAD (Continued)

ARM / ADJUSTER ASSY - REMOVAL). Identify to ensure installation in original locations.

(21) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(22) Remove spark plugs.

CLEANING

Clean all surfaces of cylinder block and cylinder heads. Be sure material does not fall into the lifters and surrounding valley.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

Clean the exhaust manifold to cylinder head mating areas.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. The out-of-flatness specifications are 0.0007 mm/mm (0.0004 inch/inch), 0.127 mm/152 mm (0.005 inch/6 inches) any direction or 0.254 mm (0.010 inch) overall across head. If exceeded, either replace head or lightly machine the head surface.

The cylinder head surface finish should be 1.78-4.57 microns (15-80 microinches).

Inspect push rods. Replace worn or bent rods.

Inspect rocker arms. Replace if worn or scored.

INSTALLATION

(1) Position the new cylinder head gaskets onto the cylinder block.

(2) Position the cylinder heads onto head gaskets and cylinder block.

(3) Tighten the cylinder head bolts in two steps (Fig. 10):

- Step 1—Tighten all cylinder head bolts, in sequence, to 58 N·m (43 ft. lbs.) torque.

- Step 2—Tighten all cylinder head bolts, in sequence, to 143 N·m (105 ft. lbs.) torque.

-

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

(4) Install push rods and rocker arm assemblies in their original position (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(5) Install lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

Fig. 10 Cylinder Head Bolt Tightening Sequence

(6) Install the upper intake manifold onto the lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(7) Install the exhaust manifolds and new gaskets (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).

(8) Install exhaust pipe to the exhaust manifold. Tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(9) Using a new gasket, position the EGR tube to the intake manifold and the exhaust manifold. Tighten the EGR tube nut to 34 N·m (25 ft. lbs.) torque. Tighten the bolts to 20 N·m (174 in. lbs.) torque.

(10) Install the heat shields and the washers. **Make sure that heat shields tabs hook over the exhaust gasket.** Tighten the nuts to 15 N·m (132 in. lbs.) torque.

(11) Adjust and Install the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - INSTALLATION).

(12) Install coil packs and bracket. Tighten the bracket bolts to 21 N·m (190 in. lbs.) torque. Connect the coil wires.

(13) Connect heat indicator sending unit wire.

(14) Connect the heater hoses and bypass hose.

(15) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(16) Install the fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION) and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(18) Install the intake manifold-to-generator bracket support rod. Tighten the bolts to 41 N·m (30 ft. lbs.) torque.

(19) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CYLINDER HEAD (Continued)

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(20) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(21) Install closed crankcase ventilation system.

(22) Connect the evaporation control system.

(23) Install the air cleaner.

(24) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(25) Connect the negative cable to the battery.

(26) Check for leaks (fuel, oil, antifreeze, etc.).

CYLINDER HEAD COVER(S)

DESCRIPTION

Die-cast magnesium cylinder head covers (Fig. 11) reduce noise and provide a good sealing surface. A steel backed silicon gasket is used with the cylinder head cover. This gasket can be used again.

Fig. 11 Cylinder Head Cover

1 - CYLINDER HEAD COVER

REMOVAL

Die-cast magnesium cylinder head covers (Fig. 13) reduce noise and provide a good sealing surface. A steel backed silicon gasket is used with the cylinder head cover (Fig. 12).

(1) Disconnect the negative cable from the battery.

(2) Disconnect closed ventilation system and evaporation control system from cylinder head cover. Identify each system for installation.

(3) Remove the upper intake manifold to remove the right side head cover (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(4) Remove cylinder head cover bolts and stud bolts. Remove the covers and gaskets (Fig. 12). The gasket may be used again.

Fig. 12 Cylinder Head Cover Gaskets

1 - CYLINDER HEAD COVER GASKETS

2 - TAB WITH NUMBER UP

CLEANING

Clean cylinder head cover gasket surface.

Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.

Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

(1) Check the gasket for use in head cover installation. If damaged, use a new gasket.

(2) Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(3) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 13). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

(4) If removed, install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

CYLINDER HEAD COVER(S) (Continued)

**Fig. 13 Cylinder Head Covers**

- 1 - CYLINDER HEAD COVER
- 2 - CYLINDER HEAD COVER GASKET

(5) Install closed crankcase ventilation system and evaporation control system onto the proper head cover. **DO NOT** switch the systems.

(6) Connect the negative cable to the battery.

(7) Start engine and check for leaks.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves (Fig. 14) are arranged in-line and inclined 18°. The rocker pivot support and the valve guides are cast integral with the heads.

VALVE SERVICE

VALVE GUIDES

Measure valve stem guide clearance as follows:

(1) Install Black Valve Guide Sleeve Tool C-6819 over valve stem for the **INTAKE** valve and install valve (Fig. 15). The special sleeve places the valve at the correct height for checking with a dial indicator.

**Fig. 14 Intake and Exhaust Valves—8.0L Engine**

- 1 - MARGIN
- 2 - VALVE SPRING RETAINER LOCK GROOVE
- 3 - STEM
- 4 - FACE

(2) Install Silver Valve Guide Sleeve Tool C-6818 over valve stem for the **EXHAUST** valve and install valve. The special sleeve places the valve at the correct height for checking with a dial indicator.

**Fig. 15 Positioning Valve Spacer Tool (Typical)**

- 1 - VALVE
- 2 - SPACER TOOL

(3) Attach Dial Indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 16).

(4) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 inch). Ream the guides for valves with over-size stems if dial indicator reading is excessive or if the stems are scuffed or scored.

Service valves with oversize stems are available as shown below

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 16 Measuring Valve Guide Wear**

1 - VALVE

2 - SPECIAL TOOL C-3339

REAMER SIZE CHART

REAMER O/S	VALVE GUIDE SIZE
0.076 mm (0.003 in.)	8.026 - 8.052 mm (0.316 - 0.317 in.)
0.381 mm (0.015 in.)	8.331 - 8.357 mm (0.316 - 0.329 in.)

(5) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 inch). Use a 2 step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a 45° face angle and a 45° to 44 1/2° seat angle (Fig. 17).

**Fig. 17 Valve Face and Seat Angles**

1 - CONTACT POINT

VALVE FACE AND SEAT ANGLES CHART

ITEM	DESCRIPTION	SPECIFICATION
A	SEAT WIDTH	1.016 - 1.524 mm
	INTAKE	(0.040 - 0.060 in.)
B	SEAT WIDTH	1.016 - 1.524 mm
	EXHAUST	(0.040 - 0.060 in.)
C	FACE ANGLE (INT. and EXT.)	45°
D	SEAT ANGLE (INT. and EXT.)	44 1/2°
D	CONTACT SURFACE	—

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 18). Valves with less than 1.190 mm (0.047 inch) margin should be discarded.

VALVE SEATS

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.038 mm (0.0015 inch) total indicator reading.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 18 Intake and Exhaust Valves**

- 1 - MARGIN
- 2 - VALVE SPRING RETAINER LOCK GROOVE
- 3 - STEM
- 4 - FACE

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of valve seats should be 1.016-1.524 mm (0.040-0.060 inch).

VALVE SPRING INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 inch. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 inch mark on the threaded stud. Be sure the zero mark is to the front (Fig. 19). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

9509-79

Fig. 19 Testing Valve Spring for Compressed

- 1 - TORQUE WRENCH
- 2 - VALVE SPRING TESTER

REMOVAL—VALVE STEM SEALS

NOTE: This procedure is done with the cylinder head installed.

- (1) Disconnect the negative cable from the battery.
- (2) Set engine basic timing to Top Dead Center (TDC) and remove air cleaner.
- (3) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).
- (4) Using suitable socket and flex handle at crankshaft retaining bolt, turn engine so that the piston of the cylinder to be worked on, is at TDC on the compression stroke.
- (5) Remove rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
- (6) With air hose attached to an adapter installed in the spark plug hole, apply 620-689 kPa (90-100 psi) air pressure.
- (7) Using Valve Spring Compressor Tool MD-998772A with adapter 6716A (Fig. 20), compress valve spring and remove retainer valve locks and valve spring.
- (8) Remove the valve stem seal.

REMOVAL—VALVES AND VALVE SPRINGS

- (1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
- (2) Special studs must be used to adapt the Valve Spring Compressor Tool to the V-10 cylinder head (Fig. 21). Install the metric end into the Special Tool MD998772A and the 5/16 end into the cylinder head.

INTAKE/EXHAUST VALVES & SEATS (Continued)

Fig. 20 Valve Spring Compressor MD-998772A with Adaptor 6716-A and Screw 6765

FITS INTO TOOL MD 998772A

FITS INTO CYLINDER HEAD

J9409-95

Fig. 21 Special Studs 6715 for V-10 Engine

- 1 - SPECIAL TOOL 6715

(3) Compress valve springs using Valve Spring Compressor Tool MD-998772A with Adapter 6716A and Screw 6765 (Fig. 22). Tap the retainer using a brass drift and ball peen hammer to loosen locks away from retainer.

(4) Remove valve retaining locks, valve spring retainers and valve springs. Check for abnormal wear, replace as required.

(5) Remove the valve stem seals.

(6) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 23). The special sleeve places the valve at the correct height for checking with a dial indicator.

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 24).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

INSTALLATION—VALVE STEM SEAL

(1) Install new seal onto valve stem.

(2) Position valve spring onto valve stem.

(3) Position Valve Spring Compressor with Adapter Studs onto cylinder head

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 23 Positioning Valve with Tool C-3973**

- 1 - VALVE
2 - SPACER TOOL

**Fig. 24 Measuring Valve Guide Wear**

- 1 - VALVE
2 - SPECIAL TOOL C-3339

(4) Compress valve spring and install retainer valve locks.

(5) Remove air hose and adapter from spark plug hole.

(6) Remove Valve Spring Compressor and Adapter Studs.

(7) Install rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(8) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. DO NOT use alternative fasteners.

(9) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION) (Fig. 25).

**Fig. 25 Cylinder Head Covers**

- 1 - CYLINDER HEAD COVER
2 - CYLINDER HEAD COVER GASKET

(10) Install closed crankcase ventilation system.

(11) Connect the evaporation control system.

(12) Install air cleaner.

(13) Connect the negative cable to the battery.

(14) Road test vehicle and check for leaks.

INSTALLATION—VALVES AND VALVE SPRINGS

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Make sure there are no burrs on valve stems.

(5) Coat valve stems with lubrication oil. Insert valves into valve guides in cylinder head.

(6) Install new seals on all valve guides (**BLACK on intake and BROWN on exhaust**). Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A,

INTAKE/EXHAUST VALVES & SEATS (Continued)

install locks and release tool. Tap the retainer with a brass or heavy plastic hammer to ensure locks have been seated.

(8) If valves and/or seats were ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. Ensure this brings spring height back to normal, 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

(9) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

ROCKER ARM / ADJUSTER ASSY

REMOVAL

(1) Disconnect spark plug wires by pulling the boot straight out in line with plug.

(2) Remove cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the rocker arm bolts and the rocker arm assembly (Fig. 26). Place rocker arm assemblies on a bench in the same order as removed.

(4) Remove the push rods and place them on a bench in the same order as removed.

Fig. 26 Rocker Arm

- 1 - ROCKER ARMS
- 2 - ROCKER ARM PEDESTALS
- 3 - RETAINER

INSTALLATION

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(1) Install the push rods in the same order as removed.

(2) Install rocker arm assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

(3) Install cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(4) Connect spark plug wires.

ENGINE BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper with Cylinder Bore Indicator Tool, Special tool 6879 or equivalent. The cylinder block should be bored and honed with new pistons and rings fitted if:

- The cylinder bores show more than 0.127 mm (0.005 inch) out-of-round.
- The cylinder bores show a taper of more than 0.254 mm (0.010 inch).
- The cylinder walls are badly scuffed or scored.

Boring and honing operation should be closely coordinated with the fitting of pistons and rings so specified clearances may be maintained.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL—CAMSHAFT BEARINGS

This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core hole plug.

NOTE: It is not advisable to attempt to replace camshaft bearings unless special removal and installation tools are available, such as recommended tool 8544 Camshaft Bushing Remover Installer.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(2) Using recommended tool 8544 Camshaft Bushing Remover Installer, Drive out bearing shells.

REMOVAL—CAMSHAFT

(1) Remove rocker arms and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify each part so it can be installed in its original location.

NOTE: The 4 corner tappets can not be removed without removing the cylinder heads and gaskets. However, they can be lifted and retained for camshaft removal.

(2) Remove the Bolts retaining the yoke retaining spider. Remove the yoke retaining spider, tappet aligning yokes and tappets.

(3) Remove upper and lower intake manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(4) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL) and timing chain and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(5) Remove camshaft thrust plate (Fig. 27).

Fig. 27 Camshaft

1 - CAMSHAFT
2 - THRUST PLATE

(6) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSTALLATION—CAMSHAFT BEARINGS

(1) Install new camshaft bearings using recommended Tool 8544 Camshaft Bushing Remover Installer, by sliding the new camshaft bearing shell over proper adapter.

(2) Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes

are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

INSTALLATION—CAMSHAFT

(1) Lubricate camshaft lobes and camshaft bearing journals. Using a long bolt, insert the camshaft into the cylinder block.

NOTE: Whenever an engine has been rebuilt, a new camshaft and/or new tappets installed, add 1 pint of Mopar® Crankcase Conditioner, or equivalent. The oil mixture should be left in engine for a minimum of 805 km (500 miles). Drain at the next normal oil change.

(2) Install camshaft thrust plate. Tighten the torx bolts to 22 N·m (16 ft. lbs.) torque.

(3) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

(4) Line up key with keyway in sprocket, then using Special Tools C-3688, C-3718 and MB990799 install crankshaft timing sprocket. Make sure the sprocket seats against the crankshaft shoulder (Fig. 28).

Fig. 28 Crankshaft Sprocket Installation

1 - SPECIAL TOOL C-3688
2 - SPECIAL TOOL C-3718
3 - SPECIAL TOOL MD990799

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(5) Install timing chain and sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) Install the crankshaft pulley/damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(9) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

(10) Install tappets and push rods in their original location.

(11) Position the tappet aligning yokes and yoke retaining spider.

(12) Install the retaining spider mounting bolts. Tighten bolts to 22 N·m (16 ft. lbs.).

(13) Install the rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(14) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(15) Install cylinder head cover (Fig. 29) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(16) Install the intake manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(17) Start engine and check for leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE—CONNECTING ROD BEARING FITTING

Fit all rods on a bank until completed. **DO NOT** alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Fig. 29 Cylinder Head Cover

- 1 - CYLINDER HEAD COVER
- 2 - CYLINDER HEAD COVER GASKET

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, be certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Bearings are available in 0.025 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

CRANKSHAFT

REMOVAL

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings

CRANKSHAFT (Continued)

is not required when a crankshaft and bearings are replaced.

(1) Remove the oil pan and oil pickup tube (refer to Oil Pan in this section for correct procedure).

(2) Remove the timing chain cover and gasket. Remove and discard the front crankshaft oil seal and cover gasket.

(3) Remove Transmission (refer to Group 21, Transmission).

(4) Remove the rear seal retainer (refer to Crankshaft Rear Seal Retainer in this section for correct procedure).

(5) Identify main bearing caps before removal (Fig. 30). Remove bearing caps and lower bearings one at a time.

J9409-72

Fig. 30 Main Bearing Identification

- 1 - MAIN BEARING CAP
- 2 - UPPER MAIN BEARINGS
- 3 - CRANKSHAFT
- 4 - LOWER MAIN BEARINGS

- (6) Remove the connecting rod bearing caps.
- (7) Lift the crankshaft straight out of the block.
- (8) Remove the upper main bearings from the block.

INSTALLATION

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

NOTE: Lubricate crankshaft main bearings with clean engine oil.

- (1) Position upper main bearings into block.
- (2) Position the crankshaft into the cylinder block.
- (3) Lubricate the main journals with clean engine oil. Install upper main bearings, caps and bolts. Follow the 2 step tightening sequence, starting with main bearing cap 1.

(4) Lubricate the connecting rod bearings and journals with clean engine oil. Carefully install connecting rods to the crankshaft.

(5) Using Special Tool 8359 Seal Installer install new oil into oil seal retainer.

(6) Using Special Tool 6687 Guide, install the rear seal retainer with a new gasket.

(7) Install the timing chain cover with a new gasket and oil seal.

(8) Prime oil pump by squirt oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(9) Apply a rearward axial load of 667 N (150 lbs-f) on crankshaft centerline, driving No.3 main cap and thrust bearing against No.3 bulkhead. Repeat procedure, driving crankshaft forward to align rear flange of thrust bearings in a common plane. Front face of No.1 main cap must not extend forward in front of face of No.1 bulkhead.

(10) Install the oil pickup tube. Tighten the bolts to 16 N·m (144 in. lbs.) torque.

(11) Install the oil pan.

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE—MAIN BEARING FITTING

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. All lower main bearing halves are interchangeable. Upper main bearing halves of No. 2, 4, and 5 are interchangeable. Upper main bearing halves of No. 1 and 6 are interchangeable, this also applies to the lower bearing halves.

The No.3 main bearing is flanged to carry the crankshaft thrust loads. This bearing is NOT interchangeable with any other bearing halves in the engine. Bearing shells are available in standard and the following undersizes: 0.25 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch). Never install an undersize bearing that will reduce clearance below specifications.

CRANKSHAFT MAIN BEARINGS (Continued)

REMOVAL

(1) Remove the oil pan and oil pump pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Identify bearing caps before removal. Remove bearing caps one at a time.

(3) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 31).

(4) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

Fig. 31 Upper Main Bearing Removal and Installation with Tool C-3059

- 1 - SPECIAL TOOL C-3059
- 2 - BEARING
- 3 - SPECIAL TOOL C-3059
- 4 - BEARING

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 31).

(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.

(3) Lubricate the main journals with clean engine oil. Install main bearing caps and bolts. Follow the 2 step tightening sequence, starting with No. 1 main bearing cap.

(4) Apply a rearward axial load of 667 N (150 lbs-f) on crankshaft centerline, driving No.3 main cap and thrust bearing against No.3 bulkhead. Repeat

procedure, driving crankshaft forward to align rear flange of thrust bearings in a common plane. Front face of No.1 main cap must not extend forward in front of face of No.1 bulkhead.

(5) Install the oil pump pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT**REMOVAL—FRONT OIL SEAL - FRONT COVER INSTALLED**

(1) Disconnect the negative cable from the battery.

(2) Remove vibration damper from the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of the cover (Fig. 32).

J9409-68

Fig. 32 Timing Chain Cover and Oil Seal

- 1 - TIMING CHAIN COVER
- 2 - OIL SEAL

REMOVAL—FRONT OIL SEAL - FRONT COVER REMOVED

(1) Remove engine front cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of the cover.

CRANKSHAFT OIL SEAL - FRONT (Continued)

INSTALLATION—FRONT OIL SEAL - FRONT COVER INSTALLED

(1) Position the crankshaft front oil seal onto seal installer special tool 6806 and C-3688 (Fig. 33). Install seal.

J9409-136

Fig. 33 Timing Chain Cover and Oil Seal

- 1 - SPECIAL TOOL C-3688
- 2 - SPECIAL TOOL 6806

(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(3) Install serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Install cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(5) Connect negative cable to the battery.

(6) Start engine and check for leaks.

INSTALLATION—FRONT OIL SEAL - FRONT COVER REMOVED

(1) Position the crankshaft front oil seal onto seal installer special tool 6806.

(2) Use tool 6761 to support timing chain cover when installing oil seal with tool 6806 (Fig. 34) install seal (Fig. 35).

(3) Install engine front cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

J9409-137

- 2 - SPECIAL TOOL 6761

CRANKSHAFT OIL SEAL - REAR

REMOVAL

NOTE: This procedure does not require the removal of the seal retainer from the engine block.

- (1) Remove the transmission.
- (2) Carefully, remove the rear seal from the retainer. Discard the oil seal.

INSTALLATION

- (1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.
- (2) Position Special Tool 6687 Seal Guide, onto the crankshaft.
- (3) Position the oil seal onto the Seal guide, then using Special Tool 8359 Seal Installer and C-4171 Driver Handle, Install the oil seal.
- (4) The seal face surface must be countersunk into the retainer.762-1.27mm (0.030-0.050 in.).
- (5) Install the transmission.
- (6) Check and verify engine oil is at correct level.
- (7) Start engine and check for leaks.

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the transmission.
- (3) Remove the drive plate / flywheel.
- (4) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (5) Remove the rear oil seal retainer mounting bolts.
- (6) Carefully remove the retainer from the engine block.

INSTALLATION

- (1) Thoroughly clean all gasket residue from the engine block.
- (2) Use extreme care and clean all gasket residue from the retainer.
- (3) Apply a small amount of Mopar® Silicone Rubber Adhesive Sealant to the retainer gasket. Position the gasket onto the retainer.
- (4) Position Special Tool 6687 Seal Guide onto the crankshaft.
- (5) Position the retainer and seal over the guide and onto the engine block.
- (6) Install the retainer mounting bolts. Tighten the bolts to 22 N·m (16 ft. lbs.).

(7) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

- (8) Install the drive plate / flywheel.
- (9) Install the transmission.
- (10) Check and verify engine oil level.
- (11) Start engine and check for leaks.

HYDRAULIC LIFTERS

DIAGNOSIS AND TESTING—HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

- (1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.
- (2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

HYDRAULIC LIFTERS (Continued)

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

LEAK-DOWN TEST

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 36).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Universal Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

Fig. 36 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove the air cleaner.

(3) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(4) Remove rocker arm assembly and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify push rods to ensure installation in original location.

(5) Remove upper and lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(6) Cut the cylinder head gasket for accessibility if the end tappets are to be removed.

(7) Remove yoke retainer spider and tappet aligning yokes (Fig. 37).

(8) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(9) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

(10) Check camshaft lobes for abnormal wear.

HYDRAULIC LIFTERS (Continued)

Fig. 37 Tappets, Aligning Yoke and Yoke Retaining Spider

- 1 - TAPPET ALIGNING YOLK
2 - YOKE RETAINING SPIDER
3 - TAPPET

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSTALLATION

- (1) Lubricate tappets.
- (2) Install tappets in their original positions. **Ensure that the oil bleed hole (if so equipped) faces forward.**
- (3) Install tappet aligning yokes. Position the yoke retainer spider over the tappet aligning yokes (Fig. 37) Install the yoke retaining spider bolts and tighten to 22 N·m (16 ft. lbs.) torque.
- (4) Install the push rods in their original location.
- (5) Install the rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
- (6) Install lower and upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
- (7) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

(8) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(9) Install the air cleaner.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

(10) Connect the negative cable to the battery.

(11) Road test vehicle and check for leaks.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons (Fig. 38) are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

The pistons have a unique dry-film lubricant coating baked onto the skirts to reduce friction. The lubricant is particularly effective during engine break-in, but with time, the material becomes embedded into cylinder bore walls and continues to reduce friction.

The pistons are LH and RH bank specific.

STANDARD PROCEDURE—PISTON FITTING

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch). The max. allowable clearance is 0.0762 mm (0.003 in.).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in.0001" INCREMENTS is required (Fig. 39). If a bore gauge is not available, do not use an inside micrometer. The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDA-**

PISTON & CONNECTING ROD (Continued)

TORY. To correctly select the proper size piston, a cylinder bore gauge capable of reading in .0001" increments is required. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

REMOVAL

- (1) Remove the engine from the vehicle (Refer to 9 - ENGINE - REMOVAL).
- (2) Remove cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).
- (3) Remove the oil pan and oil pump pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.

J9509-125

Fig. 39 Bore Gauge

- 1 - BORE GAUGE
 2 - CYLINDER BORE
 3 - 2-5/16 in.

(5) Be sure the connecting rod and connecting rod cap are identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies, rotate crankshaft center the connecting rod in the cylinder bore and at BDC. **Be careful not to nick crankshaft journals. DO NOT try to remove black coating on skirt. This is the dry film lubricant.**

(7) After removal, install bearing cap on the mating rod.

CLEANING

Clean the piston and connecting rod assembly using a suitable solvent.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

PISTON & CONNECTING ROD (Continued)

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Check the crankshaft connecting rod journal for excessive wear, taper and scoring.

(2) Check the cylinder block bore for out-of-round, taper, scoring and scuffing.

(3) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(4) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 40).

NOTE: Be sure position of rings does not change during the following step.

(5) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385).

Fig. 40 Proper Ring Installation

- 1 - TOP COMPRESSION RING GAP
UPPER OIL RING GAP
- 2 - 2ND COMPRESSION RING GAP
LOWER OIL RAIL GAP
- 3 - SPACER GAP

(6) Install connecting rod bolt protectors on rod bolts, a long protector should be installed on the numbered side of the connecting rod.

(7) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore in the bottom dead center (BDC) position. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore. Be sure the piston and rod assemblies are installed in the proper orientation (Fig. 41).

(8) The notch, groove or arrow on top of piston must be pointing toward front of engine. The larger

J9409-78

Fig. 41 Piston and Rod Orientation

- 3 - ORIENTATION BUTTON TOWARDS FRONT
(L.H. ONLY) 1, 3, 5, 7, 9

chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(9) While tapping the piston down in cylinder bore with the handle of a hammer, guide the connecting rod over the crankshaft journal.

(10) Install rod caps. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(11) Install the oil pump pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(12) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION) and cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(14) Install the engine into the vehicle (Refer to 9 - ENGINE - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE—FITTING PISTON RINGS

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 inches from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler stock in the gap. Gap for compression rings should be between 0.254-0.508 mm (0.010-0.020 inch). The oil ring gap should be 0.381- 1.397 mm (0.015-0.055 inch).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Ends should be stoned smooth after filing with Arkansas White Stone. Rings with excess gaps should not be used.

(2) Install rings and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter O, an oval depression or the word TOP (Fig. 42) (Fig. 44).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 44). An identification mark on the ring is a drill point, a stamped letter O, an oval depression or the word TOP (Fig. 42) (Fig. 44).

J9009-48

Fig. 43 Top Compression Ring Identification—Typical

- 1 - TOP COMPRESSION RING (GRAY IN COLOR)
- 2 - CHAMFER
- 3 - ONE DOT

a stamped letter O, an oval depression or the word TOP facing up (Fig. 43).

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 inch) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 inch) side clearance.

(e) Pistons with insufficient or excessive side clearance should be replaced.

Fig. 46 Crankshaft Pulley—Damper Removal

1 - 3 JAW PULLER

VIBRATION DAMPER

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Remove the following:
 - Radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
 - Accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
 - Radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL)
- (3) Remove crankshaft pulley/damper bolt and washer from end of crankshaft.
- (4) Using Special Tool, 1026 3 Jaw Puller and Special Tool 8513 Insert, remove pulley—damper from the crankshaft (Fig. 46).
- (5) Inspect crankshaft oil seal. If damaged or worn, replace the front oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - REMOVAL).

INSTALLATION

- (1) Position the crankshaft pulley/damper onto the crankshaft.
- (2) Use Special Tool, C-3688 Crankshaft Pulley/Damper Installer to press the pulley—damper onto the crankshaft. Install crankshaft bolt and washer and tighten to 312 N·m (230 ft. lbs.) torque (Fig. 47).
- (3) Install the following:
 - Radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION)

Fig. 47 Installing Crankshaft Pulley—Damper

1 - SPECIAL TOOL C-3688

FRONT MOUNT

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Position fan to assure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

- (3) Install engine support/lifting fixture.
- (4) Raise vehicle on hoist.
- (5) Lift the engine **SLIGHTLY** and remove the thru-bolt and nut (Fig. 48).
- (6) Remove engine support bracket/cushion bolts (Fig. 48). Remove the support bracket/cushion and heat shields.

J9409-144

Fig. 48 Engine Front Mounts

- 1 - ENGINE MOUNT HEAT SHIELD
- 2 - THRU-BOLT
- 3 - RESTRICTION PADS
- 4 - ENGINE SUPPORT BRACKET/CUSHION

INSTALLATION

- (1) With engine raised **SLIGHTLY**, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.
- (2) Install the thru-bolt and 2 piece rubber engine rubber restrictors onto the engine support bracket/cushion.
- (3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and thru-bolt into support cushion brackets (Fig. 49).
- (4) Install thru-bolt nuts and tighten the nuts to 68 N·m (50 ft. lbs.) torque.
- (5) Lower the vehicle.
- (6) Remove lifting fixture.

J9409-54

Fig. 49 Positioning Engine Mounts—Front

- 1 - ENGINE SUPPORT BRACKET/CUSHION
- 2 - SUPPORT CUSHION BRACKET

REAR MOUNT

REMOVAL

- (1) Raise the vehicle on a hoist.
- (2) Position a transmission jack in place.
- (3) Remove support cushion stud nuts (Fig. 50).
- (4) Raise rear of transmission and engine **SLIGHTLY**.
- (5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.
- (6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

- (1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.
- (2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.
- (3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 50).
- (4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.
- (5) Remove the transmission jack.
- (6) Lower the vehicle.

REAR MOUNT (Continued)

J9509-126

Fig. 50 Engine Rear Support Cushion Assembly

LUBRICATION

DESCRIPTION

A pressure feed type (gerotor) oil pump is located in the engine front cover. The pump uses a pick-up tube and screen assembly to gather engine oil from the oil pan (Fig. 51).

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the inner and outer gears of the oil pump, then forced through the outlet in the engine front cover. An oil gallery in the front cover channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the tappet galleries, which extends the entire length of block.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod

J9409-71

Fig. 51 Pressure Feed Type (Gerotor) Oil Pump—Typical

- 1 - OUTER ROTOR
- 2 - INNER ROTOR
- 3 - OIL PUMP COVER
- 4 - TIMING CHAIN COVER

LUBRICATION (Continued)

rotates. This oil throwoff lubricates the camshaft lobes, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the No. 1 main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets, which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide holes and the oil drain-back passages in the cylinder head, past the valve tappet area, and then returns to the oil pan (Fig. 52).

DIAGNOSIS AND TESTING—ENGINE OIL LEAKS

Begin with a through visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil-soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to be sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light source.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat previous step.

(5) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method as follows:

(6) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(7) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(8) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(9) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(10) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(11) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose. Proceed to next step.

(12) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL

STANDARD PROCEDURE—ENGINE OIL

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located at the right front of the engine, left of the generator on 3.9L engines (Fig. 53).

Fig. 53 Oil Level Indicator Location

- 1 - CYLINDER HEAD COVER
- 2 - ENGINE OIL FILL CAP
- 3 - DIPSTICK
- 4 - ENGINE OIL FILTER
- 5 - FILTER BOSS

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level.

The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading.
- (6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. This information can be found in the owner's manual.

TO CHANGE ENGINE OIL

Run engine until achieving normal operating temperature.

- (1) Position the vehicle on a level surface and turn engine off.
- (2) Hoist vehicle.
- (3) Remove oil fill cap.
- (4) Place a suitable drain pan under crankcase drain.
- (5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
- (6) Install drain plug in crankcase.
- (7) Change oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
- (8) Lower vehicle and fill crankcase with specified type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

OIL (Continued)

- (9) Install oil fill cap.
- (10) Start engine and inspect for leaks.
- (11) Stop engine and inspect oil level.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

- (1) Position a drain pan under the oil filter.
- (2) Using a suitable oil filter wrench loosen filter.
- (3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 54).

Fig. 54 Oil Filter Removal—Typical

- 1 - ENGINE OIL FILTER
- 2 - OIL FILTER WRENCH

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 54) of oil and grime.

(6) Install new filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

INSTALLATION

- (1) Lightly lubricate oil filter gasket with engine oil or chassis grease.
- (2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 55) hand tighten filter one full turn, do not over tighten.
- (3) Add oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

OIL PAN

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise vehicle.
- (3) Drain engine oil.

Fig. 55 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
- 2 - RUBBER GASKET
- 3 - OIL FILTER

- (4) Remove left engine to transmission strut.
- (5) Remove oil pan mounting bolts, pan and one-piece gasket. The engine may have to be raised slightly on 2WD vehicles.
- (6) Remove the oil pick-up tube assembly (Fig. 56). Discard the gasket.

Fig. 56 Oil Pick-Up Tube

- 1 - PICK-UP TUBE
- 2 - SEALANT AT SPLIT-LINES
- 3 - SEALANT AT SPLIT-LINE

CLEANING

Clean the block and pan gasket surfaces.

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

OIL PAN (Continued)

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

(1) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 57).

Fig. 57 Fabrication of Alignment Dowels

- 1 - 5/16" X 1 1/2" BOLT
- 2 - DOWEL
- 3 - SLOT

(2) Install the dowels in the cylinder block at the four corners.

(3) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent at the split lines. The split lines are between the cylinder block, the timing chain cover and the rear crankshaft seal assembly (Fig. 56). **After the sealant is applied you have 3 minutes to install the gasket and oil pan.**

(4) Slide the one-piece gasket over the dowels and onto the block.

(5) Position the oil pan over the dowels and onto the gasket. The engine may have to be slightly raised on 2WD vehicles.

(6) Install the oil pan bolts (Fig. 58). Tighten the bolts to as shown in Oil Pan Bolts Torque Chart.

(7) Remove the dowels. Install the remaining 5/16 inch oil pan bolts. Torque these bolts as shown in Oil Pan Bolts Torque Chart.

(8) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.

(9) Install the engine to transmission strut.

(10) Lower vehicle.

(11) Connect the negative cable to the battery.

(12) Fill crankcase with oil to proper level.

(13) Start engine and check for leaks.

Fig. 58 Oil Pan Bolt Location

- 1 - OIL PAN
- 2 - OIL FILTER
- 3 - STUD BOLTS
- 4 - DRAIN PLUG

OIL PUMP

REMOVAL

(1) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) Remove the relief valve plug, gasket, spring and valve (Fig. 59). Discard the gasket.

Fig. 59 Oil Pressure Relief Valve

- 1 - TIMING CHAIN COVER
- 2 - OIL PUMP RELIEF VALVE
- 3 - SPRING
- 4 - GASKET
- 5 - PLUG

(3) Remove mounting screws and oil pump cover (Fig. 60).

(4) Remove oil pump inner and outer rotors (Fig. 60).

OIL PUMP (Continued)

(5) Inspect oil pump for wear (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION).

Fig. 60 Oil Pump

- 1 - OUTER ROTOR
- 2 - INNER ROTOR
- 3 - OIL PUMP COVER
- 4 - TIMING CHAIN COVER

J9409-71

CLEANING

Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump cover if scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 61). If a 0.076 mm (0.003 inch) feeler gauge can be inserted between cover and straightedge, cover should be replaced.

Measure thickness (Fig. 62) (Fig. 63) and diameter of rotors. If either rotor thickness measures 14.956 mm (0.5876 inch) or less, or if the diameter is 82.45 mm (3.246 inches) or less, replace rotor set.

Slide outer rotor into timing chain cover pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 64). If clearance is 0.19 mm (0.007 inch) or more, and outer rotor is within specifications, replace timing chain cover.

Install inner rotor into timing chain cover pump body (Fig. 65). Inner rotor should be positioned with chamfer up or toward engine when cover is installed. This allows easy installation over crankshaft. If

Fig. 61 Checking Oil Pump Cover Flatness

2 - OUTER ROTOR

9309-73

Fig. 66 Measuring Clearance Over Rotors

- 1 - FEELER GAUGE
2 - STRAIGHT EDGE

clearance between inner and outer rotors is 0.150 mm (0.006 inch) or more, replace both rotors.

9309-72

Fig. 65 Measuring Inner Rotor Clearance in Cover

- 1 - FEELER GAUGE
2 - OUTER ROTOR
3 - INNER ROTOR

Place a straightedge across the face of the timing chain cover pump body, between bolt holes (Fig. 66). If a feeler gauge of 0.077 mm (0.003 inch) or more can be inserted between rotors and the straightedge, and the rotors are within specifications, replace timing chain cover.

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 100 and 109 N (22.5 and 24.5 pounds)

when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications.

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

INSTALLATION

(1) Lubricate both oil pump rotors using petroleum jelly or lubriplate and install in the timing chain cover. Use new parts as required (Fig. 67).

J9409-141

Fig. 67 Priming Oil Pump.

- 1 - FILL WITH PETROLEUM JELLY OR LUBER PLATE

OIL PUMP (Continued)

(2) Position the oil pump cover onto the timing chain cover. Tighten cover screws to 14 N·m (125 in. lbs.) torque.

(3) Make sure that inner ring moves freely after cover is installed.

(4) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(5) Squirt oil into relief valve hole until oil runs out.

(6) Install the relief valve and spring.

(7) Using a new pressure relief valve gasket, install the relief valve plug. Tighten the plug to 20 N·m (15 ft. lbs.) torque.

(8) Install oil filter that has been filled with oil.

INTAKE MANIFOLD

DESCRIPTION

The aluminum intake manifold (Fig. 68) has two plenum chambers an upper and lower which supply air to five runners each. Passages across the longitudinal center of the manifold feed air from the throttle body to the plenum chambers.

Fig. 68 Upper and Lower Intake Manifold—8.0L Engine

- 1 - UPPER INTAKE MANIFOLD
- 2 - THROTTLE BODY (MPI)
- 3 - LOWER INTAKE MANIFOLD

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS, OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPMs occurs, the area of the suspected leak has been found.
- (4) Repair as required.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (4) Remove the generator brace and generator (Fig. 69).
- (5) Remove the A/C compressor brace (Fig. 69). Remove the compressor and set aside.

Fig. 69 Generator and A/C Compressor Braces

- 1 - GENERATOR
- 2 - INTAKE MANIFOLD TO GENERATOR BRACE
- 3 - A/C COMPRESSOR
- 4 - INTAKE MANIFOLD TO A/C COMPRESSOR BRACE

INTAKE MANIFOLD (Continued)

(6) Remove the air cleaner cover and filter. Remove the air cleaner housing (Fig. 70). Discard the gasket.

Fig. 70 Air Intake Housing

1 - AIR INTAKE HOUSING

(7) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(8) Disconnect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(9) Remove the coil assemblies with the ignition wires.

(10) Disconnect the vacuum lines.

(11) Disconnect the heater hoses and bypass hose.

(12) Remove the closed crankcase ventilation and evaporation control systems.

(13) Remove the throttle body bolts and lift the throttle body off the upper intake manifold (Fig. 71). Discard the gasket.

(14) Remove upper intake manifold bolts.

(15) Lift the upper intake manifold out of the engine compartment (Fig. 71). Discard the gasket.

(16) Remove the lower intake manifold bolts and remove the manifold (Fig. 72).

(17) Discard the lower intake manifold gaskets (Fig. 73).

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

Fig. 71 Upper Intake Manifold and Throttle Body

1 - UPPER INTAKE MANIFOLD

2 - THROTTLE BODY (MPI)

3 - LOWER INTAKE MANIFOLD

Fig. 72 Lower Intake Manifold

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INSTALLATION

(1) Install the intake manifold side gaskets. Be sure that the locator dowels are positioned in the head (Fig. 74).

(2) Insert Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, into the four corner joints an excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket. The sealant should be approximately 5 mm (0.2 in.) in diameter. (Fig. 73).

INTAKE MANIFOLD (Continued)

**Fig. 73 Lower Intake Manifold Gaskets**

- 1 - INTAKE MANIFOLD GASKET
- 2 - SEALANT
- 3 - CROSS-OVER GASKETS
- 4 - SEALANT
- 5 - LOCATOR DOWELS

**Fig. 74 Intake Manifold Flange**

- 1 - LOCATOR DOWELS
- 2 - INTAKE MANIFOLD GASKETS
- 3 - LOCATOR DOWELS

(3) Position the cross-over gaskets and press firmly onto the block (Fig. 73). **BE SURE THE BLOCK IS OIL FREE.**

(4) The lower intake manifold **MUST** be installed within 3 minutes of sealant application. Carefully lower intake manifold into position on the cylinder block and heads. After intake manifold is in place, inspect to make sure seals and gaskets are in place. Finger start all the lower intake bolts.

(5) Tighten the lower intake manifold bolts in sequence to 54 N·m (40 ft. lbs.) torque (Fig. 72).

Recheck all bolts are tightened to 54 N·m (40 ft. lbs.) torque.

(6) Using a new gasket, position the upper intake manifold onto the lower intake manifold.

(7) Finger start all bolts, alternate one side to the other.

(8) Tighten upper intake manifold bolts in sequence to 22 N·m (16 ft. lbs.) torque (Fig. 71).

(9) Using a new gasket, install the throttle body onto the upper intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

(10) Install closed crankcase ventilation and evaporation control systems.

(11) Connect the heater hoses and bypass hose.

(12) Connect the vacuum lines.

(13) Install the coil assemblies and the ignition wires.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(15) Install the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(16) Using a new gasket, install the air cleaner housing. Tighten the nuts to 11 N·m (96 in. lbs.) torque. Install the air cleaner filter and cover.

(17) Install the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION). Position the compressor brace and install the bolts. Tighten the brace bolts to 41 N·m (30 ft. lbs.) torque.

(18) Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION). Position the generator brace and install the bolts. Tighten the brace bolts to 41 N·m (30 ft. lbs.) torque.

(19) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(20) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Connect the negative cable to the battery.

(22) Start engine check for leaks.

EXHAUST MANIFOLD

DESCRIPTION

Engine exhaust manifolds (Fig. 75) are made of high molybdenum ductile cast iron. A special ribbed design helps control permanent dimensional changes during heat cycles.

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the

EXHAUST MANIFOLD (Continued)

80be46d5

Fig. 75 Exhaust Manifold—8.0L Engine

1 - EXHAUST MANIFOLD

exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise and support the vehicle.
- (3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold..
- (4) Lower the vehicle.
- (5) Remove the exhaust heat shields (Fig. 76).

J9411-14

Fig. 76 8.0L Engine Exhaust Manifold—Typical

1 - EXHAUST MANIFOLD
2 - HEAT SHIELD

- (6) Remove the dipstick bracket from the exhaust manifold (right side only).

- (7) Remove bolts attaching manifold to cylinder head.

- (8) Remove manifold from the cylinder head. Discard the gasket.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

- (1) Using a new gasket position the engine exhaust manifold onto the cylinder head. Install bolts and stud bolts in the proper position. (Fig. 76) Tighten the bolts to 22 N·m (16 ft. lbs.) torque.

- (2) Install the dipstick bracket on to the exhaust manifold (right side only).

- (3) Position washers and exhaust heat shields onto the manifold stud bolts (Fig. 76). Be sure the tabs on the heat shields are hooked over the top of the exhaust gasket. Install the nuts and tighten to 20 N·m (175 in. lbs.) torque.

- (4) Raise and support the vehicle.
- (5) Assemble exhaust pipe to manifold.
- (6) Lower the vehicle.
- (7) Connect the negative cable to the battery.
- (8) Start engine check for leaks.

TIMING BELT / CHAIN COVER(S)**REMOVAL**

- (1) Disconnect the negative cable from the battery.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

- (3) Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

- (4) Remove fan and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

- (5) Unbolt A/C compressor and set on top of engine.

- (6) Remove generator, air pump, and bracket assembly.

- (7) Remove water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).

- (8) Remove damper bolt and washer.

- (9) Using Special Tool 1026 3-Jaw Puller remove pulley/damper from the crankshaft. (Fig. 77)

TIMING BELT / CHAIN COVER(S) (Continued)

J9409-138

Fig. 77 Pulley—Damper Removal

1 - 3 JAW PULLER

(10) Loosen oil pan bolts and remove the front oil pan bolts that mount the pan to the timing chain cover.

(11) Remove the cover bolts.

(12) Remove timing chain cover and gasket using extreme caution to avoid damaging oil pan gasket.

(13) Inspect surface of cover. Remove any burrs or high spots.

INSTALLATION

(1) Be sure mating surfaces of timing chain cover and cylinder block are clean and free from burrs.

(2) Lubricate the pump rotors using petroleum jelly or lubriplate (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(3) Using a new cover gasket, carefully install timing chain cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

(4) Tighten timing chain cover bolts to 47 N·m (35 ft. lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

(5) Using Special Tool C-3688 Crankshaft Pulley/Damper Installer Install pulley/vibration damper (Fig. 78)

(6) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

J9409-142

Fig. 78 Installing Crankshaft

1 - SPECIAL TOOL C-3688

(7) Install water pump and housing assembly using new o-ring (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

(8) Install generator, air pump, and bracket assembly.

(9) Install A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(10) (10) Install the radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(11) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(12) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect the negative cable to the battery.

(15) Road test vehicle and check for leaks.

TIMING BELT/CHAIN AND SPROCKETS**REMOVAL**

(1) Remove timing chain cover and gasket using extreme caution to avoid damaging oil pan gasket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(2) Aline camshaft and crankshaft centerline. Remove camshaft sprocket attaching bolt and remove timing chain and camshaft sprockets.

(3) Use puller 6444 and jaws 6820 to remove crankshaft sprocket (Fig. 79).

Fig. 79 Crankshaft Sprocket Removal.

- 1 - SPECIAL TOOL 6444
2 - SPECIAL TOOL 6820

INSPECTION—MEASURING TIMING CHAIN STRETCH

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 80).

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

Fig. 80 Measuring Timing Chain Stretch

- 1 - TORQUE WRENCH
2 - 3.175 MM (0.125 IN.)

INSTALLATION

(1) Line up key in crankshaft with keyway in sprocket, press on crankshaft timing sprocket, use tools C-3688, C-3718 and MB-990799, seat sprocket against crankshaft shoulder (Fig. 81).

Fig. 81 Crankshaft Sprocket Installation

- 1 - SPECIAL TOOL C-3688
2 - SPECIAL TOOL C-3718
3 - SPECIAL TOOL MD990799

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(2) Turn crankshaft to line up the timing mark with the crankshaft and camshaft centerline.

(3) Put chain on camshaft sprocket.

(4) Align timing marks and install chain and camshaft sprocket onto crankshaft sprocket. Check to see that timing marks are on the centerline of the crankshaft and camshaft centerline (Fig. 82).

(5) Install the camshaft bolt. Tighten the bolt to 61 N·m (45 ft. lbs.) torque.

(6) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

(7) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

J9409-69

ENGINE 5.9L DIESEL

DESCRIPTION

80c06e38

Cummins® 24 Valve Turbo Diesel Engine

The cylinder block is constructed of cast iron. The casting is a skirted design which incorporates longitudinal ribs for superior strength and noise reduction. The block incorporates metric straight thread o-ring fittings at lubrication oil access points. The engine is manufactured with the cylinders being a non-sleeved type cylinder. However, one approved service method is to bore out the cylinders and add cylinder sleeves to the cylinder block.

The cylinders are numbered front to rear (Fig. 1); 1 to 6. The firing order is 1-5-3-6-2-4.

1-5-3-6-2-4

J9409-107

ENGINE 5.9L DIESEL (Continued)

DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE LOW	<ol style="list-style-type: none"> 1. Low oil level. 2. Oil viscosity thin, diluted or wrong specification. 3. Improperly operating pressure switch/gauge. 4. Relief valve stuck open. 5. Plugged oil filter. 6. If cooler was replaced, shipping plugs may have been left in cooler 7. Worn oil pump. 8. Suction tube loose or seal leaking. 9. Loose main bearing cap. 10. Worn bearings or wrong bearings installed. 11. Oil jet under piston bad fit into main carrier. 	<ol style="list-style-type: none"> 1. (a) Check and fill with clean engine oil. (b) Check for a severe external oil leak that could reduce the pressure. 2. Verify the correct engine oil is being used. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). 3. Verify the pressure switch is functioning correctly. If not, replace switch/gauge. 4. Check/replace valve. 5. Change oil filter. 6. Check/remove shipping plugs. 7. Check and replace oil pump. 8. Check and replace seal. 9. Check and install new bearing. Tighten cap to proper torque. 10. Inspect and replace connecting rod or main bearings. Check and replace piston cooling nozzles. 11. Check oil jet position.
LUBRICATING OIL PRESSURE TOO HIGH	<ol style="list-style-type: none"> 1. Pressure switch/gauge not operating properly. 2. Engine running to cold. 3. Oil viscosity too thick. 4. Oil pressure relief valve stuck closed or binding 	<ol style="list-style-type: none"> 1. Verify pressure switch is functioning correctly. If not, replace switch/gauge. 2. Refer to Coolant Temperature Below Normal (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). 3. Make sure the correct oil is being used. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). 4. Check and replace valve.
LUBRICATING OIL LOSS	<ol style="list-style-type: none"> 1. External leaks. 2. Crankcase being overfilled. 3. Incorrect oil specification or viscosity. 	<ol style="list-style-type: none"> 1. Visually inspect for oil leaks. Repair as required. 2. Verify that the correct dipstick is being used. 3. (a) Make sure the correct oil is being used (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). (b) Look for reduced viscosity from dilution with fuel. (c) Review/reduce oil change intervals.

ENGINE 5.9L DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Oil cooler leak 5. High blow-by forcing oil out the breather. 6. Turbocharger leaking oil to the air intake. 7. Piston rings not sealing (oil being consumed by the engine).	4. Check and replace the oil cooler. 5. Check the breather tube area for signs of oil loss. Perform the required repairs. 6. Inspect the air ducts for evidence of oil transfer. Repair as required. 7. Perform blow-by check. Repair as required.
COMPRESSION KNOCKS	1. Air in the fuel system. 2. Poor quality fuel or water/gasoline contaminated fuel. 3. Engine overloaded. 4. Incorrect injection pump timing. 5. Improperly operating injectors.	1. Bleed the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). 2. Verify by operating from a temporary tank with good fuel. Clean and flush the fuel tank. Replace fuel/water separator filter. 3. Verify the engine load rating is not being exceeded. 4. Check injection pump for proper installation. 5. Check and replace inoperative injectors.
EXCESSIVE VIBRATION	1. Loose or broken engine mounts. 2. Damaged fan or improperly operating accessories. 3. Improperly operating vibration damper 4. Improperly operating viscous fan drive. 5. Worn or damaged generator bearing. 6. Flywheel housing misaligned. 7. Loose or broken power component. 8. Worn or unbalanced driveline components.	1. Replace engine mounts. 2. Check and replace the vibrating components. 3. Inspect/replace vibration damper. 4. Inspect/replace fan drive. 5. Check/replace generator. 6. Check/correct flywheel alignment. 7. Inspect the crankshaft and rods for damage that causes an unbalance condition. Repair/replace as required. 8. Check/repair driveline components.
EXCESSIVE ENGINE NOISES	1. Drive belt squeal, insufficient tension or abnormally high loading. 2. Intake air or exhaust leaks. 3. Excessive valve lash.	1. Check the automatic tensioner and inspect the drive belt. Make sure water pump, tensioner pulley, fan hub and generator turn freely. 2. Refer to Excessive Exhaust Smoke (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). 3. Adjust valves. Make sure the push rods are not bent and rocker arms, adjusting screws, crossheads, are not severely worn. Replace bent or severely worn components.

ENGINE 5.9L DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Turbocharger noise.	4. Check turbocharger impeller and turbine wheel for housing contact. Repair/replace as required.
	5. Gear train noise.	5. Visually inspect and measure gear backlash. Replace gears as required.
	6. Power function knock.	6. Check/replace rod and main bearings.

DIAGNOSIS AND TESTING—SMOKE

DIAGNOSIS CHARTS

The following charts include possible causes and corrections for **excess or abnormal** exhaust smoke.

Small amounts of exhaust smoke (at certain times) are to be considered normal for a diesel powered engine.

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	CORRECTION
Air filter dirty or plugged.	Check Filter Minder® at air filter (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
Air intake system restricted.	Check entire air intake system including all hoses and tubes for restrictions, collapsed parts or damage. Repair/replace as necessary.
Air Leak in Intake System.	Check entire air intake system including all hoses and tubes for cracks, loose clamps and/or holes in rubber ducts. Also check intake manifold for loose mounting hardware.
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures Information.
Engine Control Module (ECM) not calibrated or ECM has incorrect calibration.	Refer to Powertrain Diagnostic Procedures Information.
Exhaust system restriction is above specifications.	Check exhaust pipes for damage/restrictions. Repair as necessary.
Fuel grade is not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel injection pump malfunctioning.	A DTC should have been set. If so, refer to Powertrain Diagnostic Procedures Information.
Fuel injector malfunctioning.	A DTC should have been set. Perform "Cylinder Balance Test" using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures Information and, to (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Fuel return system restricted.	Check fuel return line by checking overflow valve (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).
Intake manifold restricted.	Remove restriction.
Manifold Air Pressure (Boost) Sensor or sensor circuit malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	CORRECTION
Raw fuel in intake manifold.	Fuel injectors leaking on engine shutdown. Do Fuel Injector Test (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Static timing not correct.	A DTC should have been set. If so, refer to Powertrain Diagnostic Procedures Information. Also (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - DIAGNOSIS AND TESTING).
Turbocharger air intake restriction.	Remove restriction.
Turbocharger damaged.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).
Turbocharger has excess build up on compressor wheel and/or diffuser vanes.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - CLEANING).
Turbocharger wheel clearance out of specification.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	CORRECTION
Air in fuel supply: Possible leak in fuel supply side (between transfer pump and fuel tank module).	(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Coolant leaking into combustion chamber.	Do pressure test of cooling system (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures Information.
In very cold ambient temperatures, engine block heater is malfunctioning (if equipped).	(Refer to 7 - COOLING/ENGINE/ENGINE BLOCK HEATER - REMOVAL).
Engine coolant temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also check thermostat operation (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING).
Engine Control Module (ECM) not calibrated or has incorrect calibration.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Fuel filter plugged.	Perform Fuel Pressure Drop Test (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Fuel grade not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel heater element or fuel heater temperature sensor malfunctioning. This will cause wax type build-up in fuel filter.	Refer to Fuel Heater Testing (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL HEATER - DIAGNOSIS AND TESTING).
Fuel injector malfunctioning.	A DTC should have been set. Perform "Cylinder Balance Test" using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures Information and, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Fuel injector hold-downs loose.	Torque to specifications.

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	CORRECTION
Fuel injector protrusion not correct.	Check washer (shim) at bottom of fuel injector for correct thickness. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION)
Fuel injection pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Fuel supply side restriction to transfer pump.	Refer to Fuel Transfer Pump Pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING)
Fuel transfer (lift) pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also refer to Fuel Transfer Pump Pressure Testing (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Intake/Exhaust valve adjustments not correct (too tight).	(Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
Intake manifold air temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Intake manifold heater circuit not functioning correctly in cold weather.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also check heater elements for correct operation.
Intake manifold heater elements not functioning correctly in cold weather.	A diagnostic trouble code WILL NOT BE SET if heater elements are malfunctioning. Refer to NTC tests in Powertrain Diagnostic Procedures Information.
Internal engine damage (scuffed cylinder).	Analyze engine oil and inspect oil filter to locate area of probable damage.
Restriction in fuel supply side of fuel system.	Refer to Fuel Transfer Pump Pressure Testing (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Static timing incorrect.	A DTC should have been set. If so, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - DIAGNOSIS AND TESTING).

EXCESSIVE BLUE SMOKE	
POSSIBLE CAUSE	CORRECTION
Dirty air cleaner or restricted turbocharger intake duct.	Check Filter Minder® at air filter housing. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
Air leak in boost system between turbocharger compressor outlet and intake manifold.	Service air charge system..
Obstruction in exhaust manifold.	Remove exhaust manifold and inspect for blockage (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
Restricted turbocharger drain tube.	Remove turbocharger drain tube and remove obstruction.
Crankcase ventilation system plugged.	Inspect crankcase breather and vent tube for sludge formation or obstructions.

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE BLUE SMOKE	
POSSIBLE CAUSE	CORRECTION
Valve seals are worn, brittle, or improperly installed.	Replace valve stem oil seals (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - REMOVAL).
Valve stems and/or guides are worn.	Remove valves and inspect valves and guides. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
Broken or Improperly installed piston rings.	Tear down engine and inspect piston rings.
Excessive piston ring end gap.	Remove pistons and measure piston ring end gap (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).
Excessive cylinder bore wear and taper.	Remove pistons and measure cylinder bore wear and taper (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).
Cylinder damage.	Remove pistons and inspect cylinder bore for cracks or porosity. Repair with cylinder liner if necessary. (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).
Piston damage.	Remove pistons and inspect for cracks, holes. Measure piston for out-of-round and taper (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSPECTION).
Turbocharger failure.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always

inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will pre-

ENGINE 5.9L DIESEL (Continued)

vent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

- (1) Disconnect the negative cable(s) from the battery.
- (2) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.
- (3) Place a shop towel around the fuel injectors to catch any fluid that may possibly be under pressure in the cylinder head. Remove the fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
- (4) With all injectors removed, rotate the crankshaft using a breaker bar and socket.
- (5) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).
- (6) Be sure all fluid has been removed from the cylinders.
- (7) Repair engine or components as necessary to prevent this problem from occurring again.
- (8) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.
- (9) Install new fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
- (10) Drain engine oil. Remove and discard the oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
- (11) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.
- (12) Install a new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
- (13) Fill engine crankcase with the specified amount and grade of oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).
- (14) Connect the negative cable(s) to the battery.
- (15) Start the engine and check for any leaks.

REMOVAL—ENGINE

- (1) Disconnect both battery negative cables.
- (2) Recover A/C refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (3) Raise vehicle on hoist.
- (4) Drain engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Remove engine oil drain plug and drain engine oil.
- (6) Lower vehicle.
- (7) Remove radiator upper hose.
- (8) Remove the cooling fan shroud-to-radiator mounting bolts.

ENGINE 5.9L DIESEL (Continued)

(9) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL). Remove the cooling fan and shroud together.

(10) Disconnect the coolant recovery bottle hose from the radiator filler neck and remove bottle from fan shroud (Fig. 2).

Fig. 2 Coolant Recovery Bottle

- 1 - T-SLOTS
- 2 - ALIGNMENT PIN
- 3 - FAN SHROUD
- 4 - COOLANT RESERVE/OVERFLOW TANK

(11) Disconnect heater core supply and return hoses from the cylinder head fitting and coolant pipe.

(12) Raise vehicle on hoist.

(13) Remove transmission and transfer case (if equipped.).

(14) Disconnect exhaust pipe from turbocharger extension pipe (Fig. 3).

(15) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(16) Disconnect A/C suction/discharge hose from the rear of the A/C compressor.

(17) Lower vehicle.

(18) Disconnect lower radiator hose from radiator outlet.

(19) **Automatic Transmission models:** Disconnect transmission oil cooler lines from radiator using special tool #6931.

(20) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(21) Remove upper radiator support panel.

(22) Remove front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL).

J9411-18

Fig. 3 Exhaust Pipe Connection at Turbocharger

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER EXHAUST PIPE

(23) If A/C equipped, disconnect A/C condenser refrigerant lines.

(24) Disconnect charge air cooler piping.

(25) Remove the two charge air cooler mounting bolts.

(26) Remove charge air cooler (and A/C condenser if equipped) from vehicle.

(27) Disconnect engine block heater connector.

(28) Disconnect A/C compressor electrical connectors.

(29) Remove the passenger battery ground cable from the engine block.

(30) Disconnect power steering pump pressure and return lines.

(31) Remove accelerator linkage cover.

(32) Leaving all cables attached, remove accelerator pedal position sensor assy. (APPS) (Fig. 4) from cylinder head bracket and secure out of the way.

(33) Disconnect APPS connector (Fig. 5).

(34) Disconnect vacuum pump supply hose (Fig. 6).

(35) Disconnect the engine harness and ground cable from the PDC.

(36) Disconnect the fuel supply and return hoses (Fig. 7).

(37) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(38) Remove the #5 and #6 cylinder intake and exhaust rocker arms and pedestals (Fig. 8). Note the original location for re-assembly.

(39) Loosen but do not remove engine mount through bolts and nuts.

(40) Attach chain across engine lift brackets.

(41) Lift engine up and out of engine compartment.

(42) Install engine to suitable engine stand.

- 1 - ROCKER ARM
2 - PEDESTAL

REMOVAL—CRANKCASE BREATHER VAPOR CANISTER

NOTE: It is recommended to empty the contents of the vapor canister at each oil and filter service interval.

- (1) Loosen cap from top of vapor canister.
- (2) Remove nut retaining canister to engine front cover.
- (3) Slide clamp upwards on hose, then remove hose from crankcase breather.

INSTALLATION—ENGINE

- (1) Install the engine with the cylinder head cover and the #5 and #6 rocker arm assemblies removed.
- (2) Lower the engine into the compartment and install the engine mount through bolts and nuts.
- (3) Tighten the mount through bolts and nuts to 88 N·m (65 ft. lbs.) torque.
- (4) Remove the engine lifting device.
- (5) Install the #5 and #6 rocker arms and pedestals in their original locations (Fig. 8). Torque the mounting bolts to 36 N·m (27 ft. lbs.) torque.
- (6) Install the cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- (7) Connect the fuel supply and return hoses (Fig. 7).
- (8) Connect the engine harness connector and ground cable to the PDC.
- (9) Connect the vacuum pump supply hose.

Fig. 9 Crankcase Breather Vapor Canister

- 1 - ENGINE FRONT COVER STUD
2 - STRAP
3 - VAPOR CANISTER
4 - NUT
5 - CAP
6 - CRANKCASE BREATHER
7 - CLAMP
8 - HOSE

- (10) Connect the APPS connector (Fig. 5).
- (11) Install the APPS assembly bracket to the cylinder head bracket.
- (12) Install the throttle linkage cover.
- (13) Connect the power steering pressure and return lines.
- (14) Connect the passenger battery ground cable to the engine block. Tighten the bolt to 77 N·m (57 ft. lbs.) torque.
- (15) Connect the engine block heater connector.
- (16) Connect the a/c compressor electrical connectors.
- (17) Install the charge air cooler and a/c condenser (if a/c equipped). Install and tighten the charge air cooler mounting bolts to 2 N·m (17 in. lbs.) torque.
- (18) Connect the charge air cooler piping. Torque all clamps to 8 N·m (72 in. lbs.) torque.
- (19) Connect the a/c refrigerant lines to the a/c condenser (if equipped).
- (20) Install the front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).
- (21) Install the radiator upper support panel.
- (22) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

ENGINE 5.9L DIESEL (Continued)

(23) Connect the transmission quick-connect oil cooler lines to the radiator. Push together until an audible "click" is heard. Verify connection by pulling apart.

(24) Raise vehicle.

(25) Connect a/c compressor suction/discharge hose (if a/c equipped).

(26) Install the radiator lower hose and clamps.

(27) Install the starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(28) Install the transmission and transfer case (if equipped).

(29) Connect the exhaust pipe to the turbocharger elbow (Fig. 3). Torque the bolts to 34 N·m (25 ft. lbs.) torque.

(30) Connect the transmission auxiliary oil cooler lines (if equipped).

(31) Lower the vehicle

(32) Connect the heater core supply and return hoses.

(33) Install the cooling fan and shroud at the same time (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(34) Install the coolant recovery bottle to the fan shroud (Fig. 2) and connect the hose to the radiator filler neck.

(35) Install the windshield washer bottle to the fan shroud and connect the pump supply hose and electrical connections.

(36) Install the radiator upper hose and clamps.

(37) Change oil filter and install new engine oil.

(38) Fill cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(39) Connect battery negative cables.

(40) Perform the fuel line air bleed procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(41) Start engine and inspect for engine oil, coolant, and fuel leaks.

INSTALLATION—CRANKCASE BREATHER VAPOR CANISTER

(1) Position vapor canister with strap over stud on engine front cover. Install retaining nut. Tighten nut 10 N·m (89 in. lbs.).

(2) If removed, position hose onto crankcase breather, then position clamp.

(3) Position lower portion of hose into vapor canister, then install and tighten cap.

SPECIFICATIONS

5.9L DIESEL

DESCRIPTION	SPECIFICATION
Engine Type	In-Line 6 Cyl. Turbo Diesel
Bore and Stroke	102.0 X 120.0 mm (4.02 X 4.72 in.)
Displacement	5.9L (359 cu. in.)
Compression Ratio	
245 H.P. Version	17.0:1
235 H.P. Version	16.3:1
Horsepower (A/T and 5 Speed M/T)	235 @ 2700 rpm
Horsepower (6 Speed M/T Only)	245 @ 2700 rpm
Torque Rating (A/T and 5 Speed M/T)	460 ft. lbs. @ 1600 rpm
Torque Rating (6 Speed M/T Only)	505 ft. lbs. @ 1600 rpm
Firing Order	1-5-3-6-2-4
Lubrication System	Pressure Feed-Full Flow With Bypass Valve
Cylinder Block	Cast Iron
Crankshaft	Induction Hardened Forged Steel
Cylinder Head	Cast Iron With Valve Seat Inserts
Combustion Chambers	High Swirl Bowl
Camshaft	Chilled Ductile Iron
Pistons	Cast Aluminum
Connecting Rods	Cross Rolled Micro Alloy
PISTONS AND CONNECTING RODS	
Piston	
Skirt Diameter	101.864 – 101.88 mm (4.0104 – 4.011 in.)
Ring Groove Clearance	
Intermediate (Max.)	0.095 mm (0.0037 in.)
Oil Control (Max.)	0.085 mm (0.0033 in.)
Piston Pins	
Pin Diameter (Min.)	39.990 mm (1.5744 in.)
Bore Diameter (Max.)	40.025 mm (1.5758 in.)

ENGINE DATA PLATE

DESCRIPTION

The engine data plate contains specific information that is helpful to servicing and obtaining parts for the engine. The data plate is located on the left side of the engine, affixed to the gear housing. Information that can be found on the data plate includes:

- Date of Engine Manufacture
- Engine Serial Number
- Control Parts List (CPL)
- Engine Rated Horsepower
- Engine Firing Order
- Engine Displacement
- Valve Lash Reset Specifications

If the engine data plate is missing or not legible, the engine serial number is used for engine identification. The engine serial number is stamped on the right side of the block, on top of the oil cooler cavity (Fig. 10).

80b4fb42

Fig. 10 Engine Serial Number Location

AIR CLEANER ELEMENT

REMOVAL

Testing Air Cleaner Element using Filter Minder

Do not attempt to unnecessarily remove the top of the air cleaner housing for air cleaner element inspection on diesel engines.

The air cleaner (filter) housing is equipped with an air Filter Minder™ gauge (Fig. 11). This air flow restriction gauge will determine when the air cleaner element is restricted and should be replaced.

The Filter Minder™ consists of a diaphragm and calibrated spring sealed inside of a plastic housing (Fig. 12). A yellow colored disc attached to the diaphragm moves along a graduated scale on the side of the Filter Minder. After the engine has been shut off, a ratcheting device located within the Filter Minder will hold the yellow disc at the highest restriction that the air cleaner element has experienced. A drop

AIR CLEANER ELEMENT (Continued)

Fig. 11 Filter Minder™—Location—Diesel Engine

- 6 - FILTER MINDER
- 7 - CLIPS (4)
- 8 - TUBE ALIGNMENT NOTCHES

in air pressure due to an air cleaner element restriction moves the diaphragm and the yellow disc will indicate the size of the air drop.

CAUTION: Certain engine degreasers or cleaners may discolor or damage the plastic housing of the Filter Minder. Cover and tape the Filter Minder if any engine degreasers or cleaners are to be used.

To test, turn the engine off. If the yellow disc (Fig. 12) has reached the red colored zone on the graduated scale, the air cleaner element should be replaced. Refer to the proceeding removal/installation paragraphs.

Resetting the Filter Minder: After the air cleaner (filter) element has been replaced, press the rubber button on the top of the Filter Minder (Fig. 12). This will allow the yellow colored disc to reset. After the button has been pressed, the yellow disc should spring back to the UP position.

If the Filter Minder gauge has reached the red colored zone, and after an examination of the air cleaner (filter) element, the element appears to be clean, the high reading may be due to a temporary condition such as snow build-up at the air intake. Temporary high restrictions may also occur if the air cleaner (filter) element has gotten wet such as during a heavy rain or snow. If this occurs, allow the element to dry out during normal engine operation. Reset the rubber button on the top of the Filter Minder and retest after the element has dried.

Fig. 12 Filter Minder™—Diesel Engine

- 1 - PRESS BUTTON TO RESET
- 2 - YELLOW DISC
- 3 - RED ZONE
- 4 - TO AIR FILTER HOUSING
- 5 - FILTER MINDER

Removal

(1) Loosen air inlet tube clamp at air cleaner housing inlet (Fig. 11). Remove this tube at air cleaner housing cover.

(2) The housing cover is equipped with four (4) spring clips (Fig. 11) and is hinged at front with plastic tabs. Unlatch clips from top of air cleaner housing and tilt housing cover up and forward for cover removal.

(3) Remove air cleaner element from air cleaner housing.

INSTALLATION

(1) Before installing a new air cleaner element, clean inside of air cleaner housing.

(2) Position air cleaner cover to tabs on front of air cleaner housing. Latch four spring clips to seal cover to housing.

(3) Install air inlet tube at air cleaner housing inlet. Note hose alignment notches at both inlet hose and air cleaner cover (Fig. 11).

(4) Position tube clamp to inlet tube and tighten to 3 N·m (25 in. lbs.) torque.

CYLINDER HEAD

DESCRIPTION

The cylinder head (Fig. 13) is constructed of cast iron and is a one piece cross flow design with four valves per cylinder. The arrangement of two intake and two exhaust valves per cylinder allows for a centrally located injector. The cylinder head also includes an integral intake manifold, an integral thermostat housing, and a longitudinal fuel return rifle, which exits at the rear of the head. The 24 valve design also includes integrally cast valve guides and hardened intake and exhaust valve seat inserts.

Fig. 13 Cylinder Head and Gasket

- 1 - THERMOSTAT BORE
- 2 - INTAKE RUNNER
- 3 - CYLINDER HEAD
- 4 - CYLINDER HEAD GASKET
- 5 - CYLINDER BLOCK

REMOVAL

- (1) Disconnect battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Drain engine coolant.
- (4) Disconnect exhaust pipe from turbocharger elbow (Fig. 14).

J9411-18

Fig. 14 Exhaust Pipe-to-Turbocharger Elbow

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER EXHAUST PIPE

- (5) Lower vehicle.
- (6) Remove air cleaner housing and snorkel from the vehicle. Cap off turbocharger air inlet to prevent intrusion of dirt or foreign material.
- (7) Disconnect cab heater core supply and return hoses from the cylinder head and heater pipe.
- (8) Disconnect turbocharger oil drain tube at rubber hose connection. Cap off open ports to prevent intrusion of dirt or foreign material.
- (9) Disconnect turbocharger oil supply line at the turbocharger end. Cap off open ports to prevent intrusion of dirt or foreign material.
- (10) Remove exhaust manifold-to-cylinder head bolts and spacers. Remove exhaust manifold and turbocharger from the vehicle as an assembly.
- (11) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (12) Remove generator upper bracket.
- (13) Disconnect radiator upper hose from the thermostat housing.
- (14) Disconnect the coolant temperature sensor connector.
- (15) Remove the engine harness to cylinder head attaching bolt at front of head.
- (16) Remove the engine harness ground fastener at front of head below the thermostat housing.

CYLINDER HEAD (Continued)

(17) Remove the throttle linkage cover (Fig. 15).

Fig. 18 High-Pressure Lines at Cylinder Head

CYLINDER HEAD (Continued)

**Fig. 19 High-Pressure Lines at Fuel Injection Pump**

- 1 - HIGH-PRESSURE LINES AT INJECTION PUMP
 2 - FITTINGS
 3 - FUEL INJECTION PUMP

(24) Remove the high pressure fuel lines (Fig. 18) (Fig. 19) from the engine as follows:

- (a) Remove all injection line-to-intake manifold cover support bracket bolts.
 - (b) Loosen the #1, 2, and 4 cylinder high pressure lines at the injection pump.
 - (c) Loosen the #1, 2, and 4 cylinder high pressure lines at the cylinder head.
 - (d) Remove the #1, 2, and 4 cylinder high pressure line bundle from the engine.
 - (e) Loosen the #3, 5, and 6 cylinder high pressure lines at the injection pump.
 - (f) Loosen the #3, 5, and 6 cylinder high pressure lines at the cylinder head.
 - (g) Remove the #3, 5, and 6 cylinder high pressure line bundle from the engine.
- (25) Remove the lift pump-to-fuel filter low pressure line.
- (26) Remove the fuel filter-to-injection pump low pressure line.
- (27) Disconnect the water-in-fuel and fuel heater connectors.

(28) Remove the fuel filter assembly-to-manifold cover bolts and remove filter assembly from vehicle.

(29) Disconnect the Intake Air Temperature and Manifold Air Pressure sensor connectors (Fig. 20).

(30) Remove the cylinder head cover (Fig. 21) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(31) Remove the rocker levers (Fig. 22), cross heads and push rods (Fig. 23). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder exhaust and the #6 cylinder intake and exhaust push rods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

**Fig. 20 IAT and MAP Sensor Location**

- 1 - MANIFOLD AIR PRESSURE (MAP) SENSOR
 2 - REAR OF CYLINDER HEAD
 3 - IAT SENSOR
 4 - ELECTRICAL CONNECTOR
 5 - ELECTRICAL CONNECTOR

(32) Remove the fuel return line banjo bolt at the rear of the cylinder head (Fig. 24). Be careful not to drop the two (2) sealing washers.

(33) Reinstall the engine lift bracket at the rear of cylinder head.

(34) Remove twenty six (26) cylinder head-to-block bolts.

(35) Attach an engine lift crane to engine lift brackets and lift cylinder head off engine and out of vehicle.

(36) Remove the head gasket and inspect for failure.

CLEANING—CYLINDER HEAD

CAUTION: Do not wire brush head surface while fuel injectors are still installed. Fuel injector damage can result.

Clean the carbon from the injector nozzle seat with a nylon or brass brush.

Scrape the gasket residue from all gasket surfaces.

Wash the cylinder head in hot soapy water solution (88°C or 140°F).

CYLINDER HEAD (Continued)

Fig. 23 Push Rod Removal

80b4faaa

Fig. 24 Fuel Drain Fitting at Rear of Head

- 1 - LINE
- 2 - WASHERS
- 3 - BANJO BOLT

After rinsing, use compressed air to dry the cylinder head.

Polish the gasket surface with 400 grit paper. Use an orbital sander or sanding block to maintain a flat surface.

CLEANING—CROSSHEADS

Clean all crossheads in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air.

CLEANING—PUSHRODS

Clean the pushrods in a suitable solvent. Rinse in hot water and blow dry with compressed air. If necessary, use a wire brush or wheel to remove stubborn deposits.

CYLINDER HEAD (Continued)

INSPECTION—CYLINDER HEAD

Inspect the cylinder head for cracks in the combustion surface. Pressure test any cylinder head that is visibly cracked. A cylinder head that is cracked between the injector bore and valve seat can be pressure tested and reused if OK; however, if the crack extends **into** the valve seat, the valve seat **must** be replaced.

Visually inspect the cylinder block and head combustion surfaces for localized dips or imperfections. Check the cylinder head and block combustion surfaces for overall out-of-flatness. If either the visual or manual inspection exceeds the limits, then the head or block must be surfaced.

Check the top surface for damage caused by the cylinder head gasket leaking between cylinders.

Inspect the block and head surface for nicks, erosion, etc.

Check the head distortion (Fig. 25). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.8 mm (2.00 inch) diameter. Overall variation end to end or side to side 0.30 mm (0.012 inch).

DO NOT proceed with the in-chassis overhaul if the cylinder head or block surface is damaged or not flat (within specifications).

Fig. 25 Cylinder Head Combustion Deck Face

- 1 - STRAIGHT EDGE
- 2 - FEELER GAUGE

Visually inspect the cylinder head bolts for damaged threads, corroded/pitted surfaces, or a reduced diameter due to bolt stretching.

If the bolts are not damaged, their “free length” should be measured using the cap screw stretch gauge provided with the replacement head gasket. Place the head of the bolt against the base of the slot and align the bolt with the straight edge of gauge (Fig. 26). If the end of the bolt touches the foot of the gauge, the bolt **must** be discarded. **The maximum bolt free length is 132.1 mm (5.200 in.).**

80b4faa9

Fig. 26 Head Bolt Stretch Gauge

INSPECTION—CROSSHEADS

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 27). Replace any crossheads that exhibit abnormal wear or cracks.

80b4fa27

Fig. 27 Inspecting Crosshead for Cracks

INSPECTION—PUSHRODS

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 28).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 29). Replace any push rod that appears to be bent.

INSTALLATION

WARNING: THE OUTSIDE EDGE OF THE HEAD GASKET IS VERY SHARP. WHEN HANDLING THE NEW HEAD GASKET, USE CARE NOT TO INJURE YOURSELF.

(1) Install a new gasket with the part number side up, and locate the gasket over the dowel sleeves.

(2) Using an engine lifting crane, lower the cylinder head onto the engine.

CYLINDER HEAD (Continued)

Fig. 28 Inspecting Push Rod for Cracks

80b4fa24

80b4fa23

Fig. 29 Inspecting Push Rod for Flatness

(3) Lightly lubricate head bolts with engine oil and install. Using the sequence shown in (Fig. 30), tighten bolts in the following steps:

- Torque bolts to 80 N·m (59 ft. lbs.)
- Torque bolts to 105 N·m (77 ft. lbs.)
- Re-check all bolts to 105 N·m (77 ft. lbs.)
- Tighten all bolts an additional ¼ turn (90°)

(4) Connect fuel return line at rear of head (Fig. 24). Install both sealing washers and torque banjo bolt to 24 N·m (18 ft. lbs.).

(5) Install push rods into their original locations (Fig. 31). **Verify that they are seated in the tappets.**

(6) Lubricate valve stem tips and install the cross-heads in their original locations.

(7) Lubricate the rocker arms and pedestals and install them in their original locations (Fig. 32). Install the bolts and torque them to 36 N·m (27 ft. lbs.).

(8) Verify that the valve lash settings are maintained (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).

(9) Install cylinder head cover (Fig. 33) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

80b46d21

Fig. 30 Cylinder Head Bolt Torque Sequence

80b4fa25

Fig. 31 Push Rod Installation

(10) Connect the IAT and MAP sensor connectors.
(11) Install the fuel filter canister assembly and torque mounting bolts to 24 N·m (18 ft. lbs.).

(12) Connect the lift pump to fuel filter low pressure line. Torque fittings to 24 N·m (18 ft. lbs.).

(13) Connect the Water-in-Fuel and Fuel Heater Element connectors at the filter assembly.

(14) Remove the engine lift bracket at rear of cylinder head.

(15) **Install the high pressure fuel lines (Fig. 18) (Fig. 19) as follows:**

(a) Lubricate the threads (both ends) of the high pressure line nuts with diesel fuel or engine oil.

(b) Install the rear line bundle (cyls. #3, 5, and 6), and tighten the threads at the head and pump by hand.

(c) Torque the connections at the cylinder head first. Torque connections to 38 N·m (28 ft. lbs.).

(d) Torque the line connections at the injection pump to 24 N·m (18 ft. lbs.).

CYLINDER HEAD (Continued)

**Fig. 32 Rocker Arms and Pedestal Installation**

2 - PEDESTAL

**Fig. 33 Cylinder Head Cover Installation**

- 1 - BOLT (5)
2 - GASKET
3 - "TOP FRONT"
4 - ISOLATOR (5)

(e) Install the front line bundle (cyls. #1, 2, and 4) following the same procedure used for the rear line bundle.

(f) Torque the connections at the cylinder head first. Torque connections to 38 N·m (28 ft. lbs.).

(g) Torque the line connections at the injection pump to 24 N·m (18 ft. lbs.).

(h) Install the injection line support bracket to intake cover/cylinder head bolts and torque to 24 N·m (18 ft. lbs.).

(16) Install the engine lift bracket at the rear of cylinder head. Torque to 77 N·m (57 ft. lbs.).

(17) Install the fuel filter to injection pump low pressure line. Inspect and replace sealing washers if necessary. Torque banjo bolts to 24 N·m (18 ft. lbs.).

(18) Using new gaskets, install the intake grid heater and air inlet housing. Torque bolts to 24 N·m (18 ft. lbs.).

(19) Connect the APPS connector (Fig. 17).

(20) Install the APPS assembly to the cylinder head bracket and torque bolts to 12 N·m (105 in. lbs.).

(21) Install the throttle linkage cover (Fig. 15).

(22) Install the charge air cooler-to-air inlet housing duct assembly. Torque all clamps to 11 N·m (100 in. lbs.).

(23) Connect intake grid heater wires.

(24) Fasten engine harness to front of cylinder head with bolt.

(25) Install engine harness ground wire and torque bolt to 24 N·m (18 ft. lbs.).

(26) Connect engine coolant temperature sensor connector.

(27) Connect radiator upper hose to thermostat housing.

(28) Install generator upper bracket and torque bolts to 41 N·m (31 ft. lbs.).

(29) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(30) Install exhaust manifold/turbocharger assembly and start all bolts/spacers by hand. Torque bolts to 43 N·m (32 ft. lbs.).

(31) Connect turbocharger oil drain tube.

(32) Perform the turbocharger pre-lube procedure. Refer to Group 11, Exhaust System and Turbocharger for the correct procedure.

(33) Connect the turbocharger oil supply line.

(34) Install air cleaner housing and duct.

(35) Raise vehicle on hoist.

(36) Install exhaust pipe to turbocharger elbow (Fig. 14). Torque bolts to 34 N·m (25 ft. lbs.).

(37) Lower vehicle.

(38) Fill engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(39) Start engine and check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

- (1) Disconnect both battery negative cables.
- (2) Loosen the five (5) cylinder head cover bolts (Fig. 34). Remove the front three bolts and leave the rear two bolts in the cover.
- (3) Lift cover off of cylinder head.

Fig. 34 Cylinder Head Cover and Gasket

- 1 - BOLT (5)
 2 - GASKET
 3 - "TOP FRONT"
 4 - ISOLATOR (5)

CLEANING

Using a suitable solvent, Clean and dry gasket mating surfaces on cylinder head and cover. Wipe gasket dry and inspect for re-use.

INSPECTION

The cylinder head cover gasket and isolators are reusable. However, should cracks be present in the rubber/silicone construction, the defective components should be replaced.

INSTALLATION

- (1) Install the gasket as shown in (Fig. 34). Make sure the gasket is properly located around the cylinder head bolts, with the words "top front" facing up and towards front of engine.

- (2) Place two bolts and isolators into the rear two mounting holes and install the cover.

- (3) Install the remaining bolts and isolators. Starting with the center bolt, torque in a circular pattern to 24 N·m (18 ft. lbs.).

- (4) Connect both battery negative cables.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel, and have chrome plated stems to prevent scuffing. The intake and exhaust valves are both similar in head diameter and overall length, but they have unique face angles which makes them non-interchangeable. The valves are distinguished by unique dimples on the exhaust valve head (Fig. 35).

The exhaust valve springs are made from high strength, chrome silicon steel. The exhaust valve springs are also exhaust brake compatible.

Fig. 35 Valve Identification

- 1 - INTAKE VALVES
 2 - EXHAUST VALVES

STANDARD PROCEDURE-VALVES, GUIDES AND SPRINGS

REMOVAL

- (1) Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

- (2) Support cylinder head on stands, or install head bolts upside down (through combustion surface side) to protect injector tips from damage from work bench.

- (3) Remove the injector clamp (Fig. 36) from the cylinder(s) to be serviced. **Do not remove the bolt shown in (Fig. 36).**

INTAKE/EXHAUST VALVES & SEATS (Continued)

(4) Install the valve spring compressor mounting base (special tool 8319-A) as shown in (Fig. 37). Reinstall the injector clamp bolt finger tight.

(5) Install the compressor top plate, washer, and nut. Using a suitable wrench, tighten the nut (clockwise) to compress the valve springs (Fig. 38) and remove the locks.

(6) Rotate the compressor nut counter-clockwise to relieve tension on the springs. Remove the spring compressor.

(7) Remove the retainers, springs, valve seals (if necessary), and valves (Fig. 39). Arrange or number all components so they can be installed in their original locations.

(8) Repeat the procedure on all cylinders to be serviced.

INTAKE/EXHAUST VALVES & SEATS (Continued)

CLEANING

Clean the valve stems with crocus cloth or a Scotch-Brite™ pad. Remove carbon with a soft wire brush. Clean valves, springs, retainers, and valve retaining locks in a suitable solvent. Rinse in hot water and blow dry with compressed air.

INSPECTION

Visually inspect the valves for abnormal wear on the heads, stems, and tips. Replace any valve that is worn out or bent (Fig. 40).

80b5cb52

Fig. 40 Visually Inspect Valves for Abnormal Wear

Measure the valve stem diameter in three places as shown in (Fig. 41).

Fig. 41 Measure Valve Stem Diameter

VALVE STEM DIAMETER

6.96 mm (0.2740 in.) MIN

7.010 mm (0.2760 in.) MAX

Measure the cylinder head valve guide bore (Fig. 42). Subtract the corresponding valve stem diameter to obtain valve stem-to-guide clearance.

VALVE SPRING FORCE 35.33 mm @ 339.8 N (1.39 IN. @ 76.4 lbs.)

Test valve spring force with tool C-647 (Fig. 45).

INSTALLATION

(1) Install new valve seals. The yellow springs are for the intake valves and the green seals are for the exhaust valves.

(2) Install the valves in their original position. The exhaust valves are identified by a dimple on the valve head (Fig. 46).

80b5cb50

Fig. 46 Valve Identification

1 - INTAKE VALVES
2 - EXHAUST VALVES

- (3) Install the valve springs and retainer.
- (4) Install the valve spring compressor tool 8319-A as shown in (Fig. 37) and (Fig. 38).
- (5) Compress the valve springs and install the valve retaining locks (Fig. 39).
- (6) Remove the compressor and repeat the procedure on the remaining cylinders.
- (7) Install the injector clamp and hold down bolts and tighten to 10 N·m (89 in. lbs.) torque.
- (8) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

STANDARD PROCEDURE—VALVE LASH ADJUSTMENT AND VERIFICATION

NOTE: To obtain accurate readings, valve lash measurements AND adjustments should only be performed when the engine coolant temperature is less than 60° C (140° F).

The 24-valve overhead system is a “low-maintenance” design. Routine adjustments are no longer necessary, however, measurement should still take place when trouble-shooting performance problems, or upon completion of a repair that includes removal and installation of the valve train components.

- (1) Disconnect battery negative cables.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(2) Remove cylinder head cover (Fig. 47) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the crankcase breather and vapor canister (Fig. 48).

Fig. 47 Cylinder Head Cover and Gasket

- 1 - BOLT (5)
- 2 - GASKET
- 3 - "TOP FRONT"
- 4 - ISOLATOR (5)

(4) Using the crankshaft barring tool #7471-B, rotate the engine and align the pump gear mark with the top dead center (TDC) mark on the gear housing cover (Fig. 49).

(5) With the engine in this position (pump gear mark at 12 o'clock), valve lash can be measured at the following rocker arms: **INTAKE 1-2-4 / EXHAUST 1-3-5**. Measure the valve lash by inserting a feeler gauge between the rocker arm socket and crosshead (Fig. 50). Refer to VALVE LASH LIMIT CHART for the correct specifications. If the measurement falls **within** the limits, adjustment/resetting **is not** necessary. If measurement finds the lash **outside** of the limits, adjustment/resetting **is** required.

VALVE LASH LIMIT CHART

INTAKE	EXHAUST
0.152 mm (0.006 in.) MIN.	0.381 mm (0.015 in.) MIN.
0.381 mm (0.015 in.) MAX.	0.762 mm (0.030 in.) MAX.

note:
If measured valve lash falls within these specifications, no adjustment/reset is necessary. Engine operation within these ranges has no adverse affect on performance, emissions, fuel economy or level of engine noise.

 2 - FEELER GAUGE
 3 - EXHAUST

(6) If adjustment/resetting is required, loosen the lock nut on rocker arms and turn the adjusting screw until the desired lash is obtained:

- **INTAKE** 0.254 mm (0.010 in.)
- **EXHAUST** 0.508 mm (0.020 in.) Tighten the lock nut and re-check the valve lash.

(7) Using the crankshaft barring tool, rotate the **crankshaft** one revolution (360°) to align the pump gear mark to the 6 o'clock position in relation to the TDC mark on the gear housing cover (Fig. 49).

(8) With the engine in this position (pump gear mark at 6 o'clock), valve lash can be measured at the remaining rocker arms: **INTAKE 3-5-6 / EXHAUST 2-4-6**. Use the same method as above for determining whether adjustment is necessary, and adjust those that are found to be outside of the limits.

(9) Install the cylinder head cover (Fig. 47) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(10) Install the fuel pump gear access cover.

(11) Connect the battery negative cables.

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the cylinder head cover (Fig. 52) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the rocker arms and crossheads (Fig. 53) from the cylinder(s) to be serviced. Mark each component so they can be installed in their original position.

(4) Remove the crankcase breather vapor canister and breather housing (Fig. 55).

(5) Using the crankshaft barring tool #7471-B (Fig. 51), rotate the engine to line up the mark on the pump gear with the TDC mark on the cover. **At this engine position, cylinders #1 and #6 can be serviced.**

(6) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) With the fuel injection pump gear mark aligned at TDC, add a paint mark anywhere on the gear housing cover next to the crankshaft damper. Place another mark on the vibration damper in alignment with the mark you just made on the cover.

(8) Divide the crankshaft damper into three equally sized segments as follows:

(a) Using a tape measure, measure the circumference of the crankshaft damper and divide the measurement by three (3).

(b) Measure that distance in a counter-clockwise direction from the first balancer mark and place another mark on the balancer.

(c) From the second damper mark, again measure in a counter-clockwise direction and place a mark on the damper at the same distance you measured when placing the second damper mark.

INTAKE/EXHAUST VALVES & SEATS (Continued)

The damper should now be marked in three equally spaced locations and the fuel pump gear mark should still be aligned with the TDC mark on the cover.

Fig. 51 Rotating Engine with Barring Tool

- 1 - REAR FLANGE
- 2 - BARRING TOOL

(9) Compress the valve springs at cyls. #1 and #6 as follows:

(a) Remove the injector clamp (Fig. 54) from the cylinder(s) to be serviced. **Do not remove the bolt shown in (Fig. 54).**

(b) Install the valve spring compressor mounting base as shown in (Fig. 56). Reinstall the injector clamp bolt finger tight.

(c) Install the top plate, washer, and nut. Using a suitable wrench tighten the nut (clock-wise) (Fig. 57) to compress the valve springs and remove the collets.

(d) Rotate the compressor nut counter-clockwise to relieve tension on springs. Remove spring compressor.

(e) Remove and replace retainers, springs, and seals as necessary.

(f) **Do not rotate the engine until the springs and retainers are re-installed.**

(g) Install seals, springs and retainers. Install spring compressor, compress valve springs and install the collets.

(h) Release the spring tension and remove the compressor. Verify that the collets are seated by tapping on the valve stem with a plastic hammer.

(10) Using the crankshaft barring tool, rotate the engine until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #2 and #5 can be serviced.**

(11) Repeat the valve spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

(12) Using the crankshaft barring tool, rotate the engine until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #3 and #4 can be serviced.**

(13) Repeat the spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

INSTALLATION

(1) Install all injector clamps into their original location (Fig. 54). Tighten the hold down bolt to 10 N·m (89 in. lbs.) torque.

(2) Lubricate the valve tips and install the cross-heads in their original locations.

(3) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals in their original locations (Fig. 53). Tighten bolts to 36 N·m (27 ft. lbs.) torque.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(4) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(5) Install cylinder head cover and reusable gasket (Fig. 52) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(7) Connect battery negative cables.

ROCKER ARM / ADJUSTER ASSY

DESCRIPTION

The 24-valve overhead system incorporates rocker arms that are designed to allow fuel injector service without removing the rocker arms and pedestals. The unique intake and exhaust rocker arms have their own rocker shafts and are lubricated by passages intersecting the cylinder block main oil rifle. Cross-heads are used (Fig. 58), which allow each rocker arm to operate two valves.

The solid push rods are hardened at the rocker arm and tappet contact areas for superior strength and durability.

Fig. 58 Overhead System Components

- 3 - ROCKER SHAFT
- 4 - SOCKET
- 5 - ADJUSTING SCREW LOCK NUT
- 6 - PUSH ROD
- 7 - PEDESTAL
- 8 - CROSSHEAD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove cylinder head cover (Fig. 59) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the rocker arm/pedestal fasteners (Fig. 60) and remove rocker arm and pedestal from cylinder head. Mark the arms and pedestals so they can be installed in their original position.

CAUTION: When removing the rocker arms, the sockets (Fig. 61) may come loose and fall into the engine. Make sure they stay with the arm upon removal/installation.

(4) Lift the push rod(s) up and out of the engine (Fig. 62). Mark them so they can be installed in their original position.

NOTE: The #5 cyl. exhaust and #6 cyl. intake and exhaust push rods must be raised through the provided cowl panel access holes.

(5) Lift the crosshead(s) off of the valve stems. Mark them so they can be installed in their original position.

INSPECTION

Rocker Arms

(1) Remove rocker shaft and inspect for cracks and excessive wear in the bore or shaft. Remove socket and inspect ball insert and socket for signs of wear. Replace retainer if necessary.

Measure the rocker arm bore and shaft (Fig. 63) (Fig. 64).

80b4fa28

Fig. 63 Measuring Rocker Arm Bore

ROCKER ARM BORE (MAX.)
22.027 mm (.867 in.)

CLEANING

Clean all components in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air. Inspect oil passages in rocker arms and pedestals. Apply compressed air to lubrication orifices to purge contaminants.

ROCKER ARM / ADJUSTER ASSY (Continued)

ROCKER ARM SHAFT (MIN.)

21.965 mm (.865 in.)

80b4fa23

Fig. 66 Inspecting Push Rod for Flatness**Push Rods**

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 65).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 66). Replace any push rod that appears to be bent.

80b4fa24

Fig. 65 Inspecting Push Rod for Cracks

80b4fa27

Fig. 67 Inspecting Crosshead for Cracks

their original locations. Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(4) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(5) Install cylinder head cover and reusable gasket (Fig. 59) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Connect battery negative cables.

Crossheads

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 67).

INSTALLATION

(1) If previously removed, install the push rods in their original location. **Verify that they are seated in the tappets.**

(2) Lubricate the valve tips and install the crossheads in their original locations.

(3) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals (Fig. 60) in

ENGINE BLOCK**STANDARD PROCEDURE-CYLINDER BLOCK REFACING**

(1) The combustion deck can be refaced twice. The first reface should be 0.25 mm (0.0098 inch). If additional refacing is required, an additional 0.25 mm (0.0098 inch) can be removed. Total allowed refacing is 0.50 mm (0.0197 inch) - (Fig. 68).

ENGINE BLOCK (Continued)

80a82c94

Fig. 68 Refacing Dimensions of the Cylinder Block

CYLINDER BLOCK REFACING DIMENSIONS

DIMENSION "A"

1st Reface	0.25mm	(0.0098 in.)
2nd Reface	0.25mm	(0.0098 in.)
Dim (A) Total	0.50 mm	(0.0197 in.)

DIMENSION "B"

Dim. "B" (STD.)	323.00 mm ± 0.10 mm	(12.7165 in. ± 0.0039 in.)
1st Reface	322.75 mm ± 0.10 mm	(12.7067 in. ± 0.0039 in.)
2nd Reface	322.50 mm ± 0.10 mm	(12.6968 in. ± 0.0039 in.)

(2) The upper right corner of the rear face of the block must be stamped with a X when the block is refaced to 0.25 mm (0.0098 inch). A second X must be stamped beside the first when the block is refaced to 0.50 mm (0.0197 inch) - (Fig. 69).

J9109-116

Fig. 69 Stamp Block after Reface

(3) Consult the parts catalog for the proper head gaskets which must be used with refaced blocks to ensure proper piston-to-valve clearance.

STANDARD PROCEDURE-CYLINDER BORE - DE-GLAZE

(1) New piston rings may not seat in glazed cylinder bores.

(2) De-glazing gives the bore the correct surface finish required to seat the rings. The size of the bore is not changed by proper de-glazing.

(3) Cover the lube holes in the top of the block with waterproof tape.

(4) A correctly honed surface will have a cross-hatch appearance with the lines at 15° to 25° angles (Fig. 70). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

**Fig. 70 Cylinder Bore Crosshatch Pattern**

(5) Use a drill, a fine grit Flex-hone and a mixture of equal parts of mineral spirits and SAE 30W engine oil to de-glaze the bores.

(6) The crosshatch angle is a function of drill speed and how fast the hone is moved vertically (Fig. 71).

(7) Vertical strokes MUST be smooth continuous passes along the full length of the bore (Fig. 71).

**Fig. 71 De-Glazing Drill Speed and Vertical Speed**

(8) Inspect the bore after 10 strokes.

(9) Use a strong solution of hot water and laundry detergent to clean the bores. Clean the cylinder bores immediately after de-glazing.

(10) Rinse the bores until the detergent is removed and blow the block dry with compressed air.

ENGINE BLOCK (Continued)

(11) Check the bore cleanliness by wiping with a white, lint free, lightly oiled cloth. If grit residue is still present, repeat the cleaning process until all residue is removed. Wash the bores and the complete block assembly with solvent and dry with compressed air.

(12) Be sure to remove the tape covering the lube holes after the cleaning process is complete.

STANDARD PROCEDURE—CYLINDER BORE REPAIR

Cylinder bore(s) can be repaired by one of two methods:

- Method 1:—Over boring and using oversize pistons and rings.
- Method 2:—Boring and installing a repair sleeve to return the bore to standard dimensions.

METHOD 1—OVERSIZE BORE

Cylinder bore(s) can be repaired by one of two methods:

Oversize pistons and rings are available in two sizes - 0.50 mm (0.0197 inch) and 1.00 mm (0.0393 inch).

Any combination of standard, 0.50 mm (0.0197 inch) or 1.00 mm (0.0393 inch) overbore may be used in the same engine.

If more than 1.00 mm (0.0393 inch) overbore is needed, a repair sleeve can be installed (refer to Method 2—Repair Sleeve).

Cylinder block bores may be bored twice before use of a repair sleeve is required (Fig. 72). The first bore is 0.50 mm (0.0197 inch) oversize. The second bore is 1.00 mm (0.0393 inch) oversize.

After boring to size, use a honing stone to chamfer the edge of the bore (Fig. 72).

Fig. 72 Cylinder Bore Dimensions

80bb0c38

1 - CHAMFER

CYLINDER BORE DIMENSION CHART

DESCRIPTION	MEASUREMENT
BORING DIAMETER DIMENSION	1st. REBORE - 102.469 mm (4.0342 in.)
	2nd. REBORE - 102.969 mm (4.0539 in.)
HONING DIAMETER DIMENSIONS	STANDARD - 102.020 ± 0.020 mm (4.0165 ± 0.0008 in.)
	1st. REBORE - 102.520 ± 0.020 mm (4.0362 ± 0.0008 in.)
	2nd. REBORE - 103.020 ± 0.020 mm (4.0559 ± 0.0008 in.)
CHAMFER DIMENSIONS	Approx. 1.25 mm (0.049 in.) by 15°

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block (Fig. 73). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

Fig. 73 Crosshatch Pattern of Repaired Sleeve(s)

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry.

Check the bore cleanliness by wiping with a white, lint-free, lightly-oiled cloth. There should be no grit residue present.

If the block is not to be used right away, coat it with a rust- preventing compound.

METHOD 2—REPAIR SLEEVE

If more than a 1.00 mm (0.03937 inch) diameter oversize bore is required, the block must be bored and a repair sleeve installed.

Bore the block cylinder bore to 104.500-104.515 mm (4.1142-4.1148 inch) - (Fig. 74).

ENGINE BLOCK (Continued)

Repair sleeves can be replaced by using a boring bar to bore out the old sleeve. DO NOT cut the cylinder bore beyond the oversize limit.

80bb0c37

Fig. 74 Block Bore for Repair Sleeve Dimensions

- 1 - BORE DIAMETER
2 - STEP DIMENSION

REPAIR SLEEVE BLOCK REBORE
DIMENSIONS CHART

BORE DIAMETER	STEP DIAMETER
104.500 + 0.015 mm (4.1142 + 0.0006 in.)	6.35 mm (0.25 in.)

After machining the block for the new repair sleeve, thoroughly clean the bore of all metal chips, debris and oil residue before installing the sleeve.

Cool the repair sleeve(s) to a temperature of -12°C (10°F) or below for a minimum of one hour. Be ready to install the sleeve immediately after removing it from the freezer.

Apply a coat of Loctite 620, or equivalent to the bore that is to be sleeved.

Wear protective gloves to push the cold sleeve into the bore as far as possible.

Using a sleeve driver, drive the sleeve downward until it contacts the step at the bottom of the bore (Fig. 75).

A sleeve driver can be constructed as follows (Fig. 76).

- 1 - SLEEVE DRIVER
2 - SLEEVE
3 - CONTACT

80bb0c3a

Fig. 76 Sleeve Driver Construction

SLEEVE MACHINING DIMENSIONS CHART

ITEM	MEASUREMENT
SLEEVE PROTRUSION	MIN. - FLUSH WITH BLOCK
	MAX. - 0.050 mm (0.0019 in.)
SLEEVE DIAMETER	101.956 mm (4.014 in.)
SLEEVE CHAMFER	APPROX. 1.25 mm (0.049 in.) by 15°

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block. For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

Finished bore inside dimension is 102.020 \pm 0.020 mm (4.0165 \pm 0.0008 inch).

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry with compressed air.

Wipe the bore with a white, lint-free, lightly oiled cloth. Make sure there is no grit residue present.

Apply a rust-preventing compound if the block will not be used immediately.

A standard diameter piston and a piston ring set must be used with a sleeved cylinder bore.

STANDARD PROCEDURE—CAM BORE REPAIR

The front cam bushing bore can be bored to 59.235 mm \pm 0.013 mm (2.332 inch \pm 0.0006 inch) oversize. DO NOT bore the intermediate or rear cam bore to the front cam bore oversize dimensions. Intermediate and rear cam bores may be bored to 57.235 mm \pm 0.013 mm (2.253 inch \pm 0.0006 inch) oversize.

A surface finish of 2.3 micrometers (92 microinch) must be maintained. Not more than 20% of an area of any one bore may be 3.2 micrometers (126 microinch).

Camshaft bores can be repaired individually. It is not necessary to repair undamaged cam bores in order to repair individually damaged cam bores. The standard front bushing cannot be used to repair intermediate or rear bores.

Install all cam bushings flush or below the front cam bore surface. The oil hole must align to allow a 3.2 mm (0.125 inch) rod to pass through freely (Fig. 78).

Fig. 78 Oil Hole Alignment

- 1 - CAMSHAFT BUSHING

INSPECTION

Measure the combustion deck face using a straight edge and a feeler gauge (Fig. 79). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.00 mm (2.0 inch) diameter. Overall variation end to end or side to side is 0.075 mm (0.003 inch).

If the surface exceeds the limit,

Inspect the cylinder bores for damage or excessive wear.

Measure the cylinder bores (Fig. 80). If the cylinder bores exceeds the limit, (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).

Inspect the camshaft bores for scoring or excessive wear.

Measure the camshaft bores (Refer to 9 - ENGINE - SPECIFICATIONS). Limit for the No.1 bore applies to the ID of the bushing.

If a bore exceeds the limit, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - STANDARD PROCEDURE).

ENGINE BLOCK (Continued)

**Fig. 79 Combustion Deck Face Measurement**

80bb0c56

Fig. 80 Cylinder Bore Diameter

Inspect the tappet bores for scoring or excessive wear 16.000 mm min - 16.055 mm max (.63 in. min - .6321 in. max) (Fig. 81). If out of limits, replace the cylinder block.

80bb0c46

Fig. 81 Tappet Bore Diameter

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL—CAMSHAFT BEARINGS

NOTE: Measure the diameter of each bore. (The limit for the bushing in the No.1 bore is the same as for the other bores without bushings). The limit of the inside diameter is 54.089 min. - 54.164 max. mm (2.1295 min. - 2.1325 max. inch). If the camshaft bore for the first cam bushing is worn beyond the limit, install a new service bushing. Inspect the rest of the camshaft bores for damage or excessive wear. If the bores without a bushing are worn beyond the limit, the engine must be removed for machining and installation of service bushings. If badly worn, replace the cylinder block.

(1) Remove the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(2) Remove the bushing from the No.1 bore, using a universal cam bushing tool.

(3) Mark the cylinder block so you can align the oil hole in the cylinder block with the oil hole in the bushing.

REMOVAL—CAMSHAFT

(1) Disconnect both battery negative cables.

(2) Recover A/C refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(3) Raise vehicle on hoist.

(4) Drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Lower vehicle.

(6) Remove radiator upper hose.

(7) Remove viscous fan/drive assembly and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(8) Disconnect the coolant recovery bottle hose from the radiator filler neck.

(9) Disconnect lower radiator hose from radiator outlet.

(10) **Automatic Transmission models:** Disconnect transmission oil cooler lines from radiator using Special Tool 6931 (unless equipped with finger-release disconnect).

(11) Remove radiator mounting screws and lift radiator out of engine compartment.

(12) Remove upper radiator support panel.

(13) Remove front bumper assembly (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL).

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(14) If A/C equipped, disconnect A/C condenser refrigerant lines.

(15) Disconnect charge air cooler piping from the cooler inlet and outlet.

(16) Remove the two charge air cooler mounting bolts.

(17) Remove charge air cooler (and A/C condenser if equipped) from vehicle.

(18) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(19) Remove the fan support/hub assembly (Fig. 82).

(20) Remove crankshaft damper (Fig. 83) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(21) Remove the crankcase breather vapor canister from the gear housing cover (Fig. 84).

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

(26) Raise the tappets as follows, using the wooden dowel rods (Fig. 88) provided with the Miller Tool Kit 8502 or Cummins tappet replacement tool kit #3822513:

(a) Insert the slotted end of the dowel rod into the tappet. **The dowel rods for the rear two cylinders will have to be cut for cowl panel clearance.** Press firmly to ensure that it is seated in the tappet.

(b) Raise the dowel rod to bring the tappet to the top of its travel, and wrap a rubber band around the dowel rods (Fig. 88) to prevent the tappets from dropping into the crankcase.

(c) Repeat this procedure for the remaining cylinders.

(27) Verify that the camshaft timing marks are aligned with the crankshaft and injection pump marks (Fig. 89).

Fig. 88 Use Wooden Dowel Rods to Secure Tappets in Place

(28) Remove the bolts from the thrust plate (Fig. 90).

CAUTION: When removing the camshaft and thrust plate, grab the thrust plate to prevent it from falling into the crankcase.

JOURNAL DIAMETER #1 54.028 mm (2.1270 in.) MIN.

JOURNAL DIAMETER #2 - 7 53.987 mm (2.1245 in.) MIN.

LOBE HEIGHT INTAKE 47.173 mm (1.857 in.) MIN.

LOBE HEIGHT EXHAUST 45.636 mm (1.796 in.) MIN.

CAUTION: If Camshaft lobes are worn, requiring camshaft replacement, it is necessary to replace the tappets also. (Refer to 9 - ENGINE/ENGINE BLOCK/SOLID LIFTERS - REMOVAL).

Camshaft Bushing/Bores

Camshaft bores No. 2-7 **do not** use a bushing.

(1) Inspect the camshaft bushing and bores for signs of excessive wear.

(2) Measure the camshaft bushing and bores (Fig. 93) with a telescoping bore gauge and micrometer. If out of specification, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(3) Inspect the camshaft bushing oil hole for alignment with cylinder block (Fig. 94).

80b4fa38

Fig. 93 Measuring Camshaft Bushing and Bores

J9109-54

Fig. 94 Inspecting Oil Hole Alignment

1 - CAMSHAFT BUSHING

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

Camshaft Gear

Inspect the camshaft gear for cracks (gear and hub) (Fig. 95), and chipped/broken/fretted teeth (Fig. 96). If replacement is necessary, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

80b4fa30

Fig. 95 Inspect Camshaft Gear Hub for Cracks

80b4fa31

Fig. 96 Inspect Camshaft Gear for Cracks and Fretting

Thrust Plate

Inspect the camshaft thrust plate for excessive wear in the camshaft contact area. Measure thrust plate thickness using the CAMSHAFT THRUST PLATE THICKNESS CHART. Replace any thrust plate that falls outside of these specifications:

CAMSHAFT THRUST PLATE THICKNESS
CHART

9.34 mm (0.368 in.) MIN.

9.58 mm (0.377 in.) MAX.

INSTALLATION—CAMSHAFT BEARINGS

(1) Apply a coating of Loctite® 640 Adhesive to the backside of the new bushing. Avoid getting adhesive in the oil hole.

(2) Use a universal cam bushing installation tool and install the bushing so that it is even with the front face of the cylinder block. The oil hole must be aligned. A 3.2 mm (0.128 inch) diameter rod must be able to pass through the hole (Fig. 97).

(3) Measure the installed bushing. The limit of the inside diameter is 54.133 mm (2.1312 inch).

J9109-54

Fig. 97 Oil Hole Alignment

1 - CAMSHAFT BUSHING

INSTALLATION—CAMSHAFT

(1) Lubricate the camshaft bushing and bores with fresh engine oil or suitable equivalent.

(2) Liberally coat the camshaft lobes, journals, and thrust washer with fresh engine oil or suitable equivalent.

CAUTION: When installing the camshaft (Fig. 91), **DO NOT** push it in farther than it will go with the thrust washer in place. Pushing it too far can dislodge the plug in the rear of the camshaft bore and cause an oil leak.

(3) Install the camshaft (Fig. 91) and thrust plate. Align the timing marks as shown in (Fig. 89).

(4) Install the thrust plate bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Measure camshaft back lash and end clearance (Fig. 98).

(6) Remove the wooden dowel rods and rubber bands from the tappets.

(7) Lubricate the push rods with engine oil and install in their original location (Fig. 87). **Verify that they are seated in the tappets.**

(8) Lubricate the valve tips with engine oil and install the crossheads in their original locations.

(9) Lubricate the crossheads and push rod sockets with engine oil and install the rocker arms and pedestals in their original locations (Fig. 86). Tighten bolts to 36 N·m (27 ft. lbs.) torque.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

3 - CAMSHAFT GEAR CLEARANCE

BACKLASH — 0.152—0.33 mm
(0.006—0.013 inch)CLEARANCE — 0.1—0.46 mm
(0.004—0.0182 inch)

(10) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(11) Install the cylinder head cover and reusable gasket (Fig. 85) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(12) Install gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - INSTALLATION).

(13) Install the crankshaft damper (Fig. 83) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(14) Install the fan support/hub assembly (Fig. 82) and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(15) Install the crankcase breather housing (Refer to 9 - ENGINE - INSTALLATION).

(16) Install the charge air cooler (with a/c condenser and auxiliary transmission oil cooler, if equipped) and tighten the mounting bolts to 2 N·m (17 in. lbs.) torque.

(17) Connect charge air cooler inlet and outlet pipes. Tighten clamps to 10 N·m (100 in. lbs.) torque.

(18) Install the radiator upper support panel.

(19) Close radiator petcock and lower the radiator into the engine compartment. Tighten the mounting bolts to 11 N·m (95 in. lbs.) torque.

(20) Raise vehicle on hoist.

(21) Connect radiator lower hose and install clamp.

(22) Connect transmission auxiliary oil cooler lines (if equipped).

(23) Lower vehicle.

(24) Install the fan shroud and tighten the mounting screws to 6 N·m (50 in. lbs.) torque.

(25) Install the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(26) Install the coolant recovery and windshield washer fluid reservoirs to the fan shroud.

(27) Connect the coolant recovery hose to the radiator filler neck.

(28) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(29) Install the front bumper assembly (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).

(30) Add engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(31) Charge A/C system with refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(32) Connect the battery negative cables.

(33) Start engine and check for engine oil and coolant leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE—CONNECTING ROD BEARING AND CRANKSHAFT JOURNAL CLEARANCE

Measure the connecting rod bore with the bearings installed and the bolts tightened to 100 N·m (73 ft. lbs.) torque.

Record the smaller diameter.

Measure the diameter of the rod journal at the location shown (Fig. 99). Calculate the average diameter for each side of the journal.

The clearance is the difference between the connecting rod bore (smallest diameter) and the average diameter for each side of the crankshaft journal.

CONNECTING ROD JOURNAL DIAMETER LIMITS CHART

DESCRIPTION	MEASUREMENT
CRANKSHAFT ROD JOURNAL DIAMETER	MINIMUM 68.962 mm (2.715 in.)
	MAXIMUM 69.013 mm (2.717 in.)
OUT-OF-ROUND	MAXIMUM 0.050 mm (0.002 in.)
TAPER	MAXIMUM 0.013 mm (0.0005 in.)
BEARING CLEARANCE	MAXIMUM 0.089 mm (0.0035 in.)

CONNECTING ROD BEARINGS (Continued)

Fig. 99 Connecting Rod Journal Diameter Limits
CONNECTING ROD JOURNAL DIAMETER
LIMITS CHART

DESCRIPTION	MEASUREMENT
CRANKSHAFT ROD JOURNAL DIAMETER	MINIMUM 68.962 mm (2.715 in.) MAXIMUM 69.013 mm (2.717 in.)
OUT-OF-ROUND	MAXIMUM 0.050 mm (0.002 in.)
TAPER	MAXIMUM 0.013 mm (0.0005 in.)
BEARING CLEARANCE	MAXIMUM 0.089 mm (0.0035 in.)

If the crankshaft is within limits, replace the bearing. If the crankshaft is out of limits, grind the crankshaft to the next smaller size and use oversize rod bearings.

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 100) is a forged steel, integrally balanced unit. It is supported by seven main bearings, with position number six designated as the thrust journal. The crankshaft is held in place by main caps and 12 mm capscrews. The crankshaft also has internal cross drillings to supply the connecting rods with engine oil.

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE—MAIN BEARING CLEARANCE

Inspect the main bearing bores for damage or abnormal wear.

Install the crankshaft main bearings and measure main bearing bore diameter with the main bolts tightened to 176 N·m (130 ft. lbs.) torque (Fig. 101).

Fig. 100 Crankshaft

Fig. 101 Crankshaft Main Bearing Bore Diameter

1 - MAIN BEARING CAPS

MAIN BEARING BORE DIAMETER CHART

ITEM	MAIN BEARING BORE DIAMETER (MAXIMUM)
A	83.106 mm 3.2719 in.)

Measure the diameter of the main journal at the locations shown (Fig. 102). Calculate the average diameter for each side of the journal.

CRANKSHAFT MAIN BEARINGS (Continued)

Fig. 102 Crankshaft Main Journal Diameter

CRANKSHAFT MAIN JOURNAL DIAMETER CHART

ITEM	SPECIFICATION
MINIMUM DIAMETER	82.962 mm (3.2662 in.)
MAXIMUM DIAMETER	83.013 mm (3.2682 in.)

Calculate the main bearing journal to bearing clearance. the clearance specifications are 0.119 mm (0.00475 inch). If the crankshaft journal is within limits, replace the main bearings. If not within specifications, grind the crankshaft to next size and use oversize bearings.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

- (1) Disconnect both battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (4) Lower vehicle.
- (5) Remove radiator upper hose.
- (6) Disconnect coolant recovery bottle from radiator filler neck and lift bottle off of fan shroud.
- (7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.
- (8) Remove the fan shroud-to-radiator mounting bolts.
- (9) Remove viscous fan/drive assembly. **The fan drive nut has left handed threads.** (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (10) Remove cooling fan shroud and fan assembly from the vehicle.

- (11) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (12) Remove the cooling fan support/hub from the front of the engine (Fig. 103).
- (13) Raise the vehicle on hoist.
- (14) Remove the crankshaft damper (Fig. 104).
- (15) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.
- (16) Support the cover on a flat work surface with wooden blocks (Fig. 105), and using a suitable punch and hammer, drive the old seal out of the cover from the outside of the cover (Fig. 105).

Fig. 103 Fan Support Hub Assembly—Removal/Installation

CRANKSHAFT OIL SEAL - FRONT (Continued)

80b46d25

Fig. 105 Removing Seal from Cover

1 - PUNCH

INSTALLATION

(1) Clean cover and housing gasket mating surfaces. Use a suitable scraper and be careful not to damage the gear housing surface, since it is aluminum. Remove any old sealer from the oil seal bore. Thoroughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

(2) Inspect the gear housing and cover for cracks and replace if necessary. Carefully straighten any bends or imperfections in the gear cover with a ball-peen hammer on a flat surface. Inspect the crankshaft front journal for any grooves or nicks that would affect the integrity of the new seal.

(3) Apply a bead of Mopar® Stud & Bearing Mount to the outside diameter of the seal. Do not lubricate the inside diameter of the new seal.

(4) With the cover supported by wood blocks, install the seal into the rear of the cover using crankshaft seal installer Special Tool 8281 and driver handle C-4171 (Fig. 106). Strike the driver handle until the installation tool bottoms out on the inside of the cover.

(5) Install the plastic seal pilot (provided with seal kit) into the crankshaft seal.

(6) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

(7) Install the cover to the gear housing, aligning the seal pilot with the nose of the crankshaft (Fig. 107).

(8) Install the cover bolts and tighten to 24 N·m (18 ft. lbs.) torque. Remove pilot tool.

(9) Install the crankshaft damper (Fig. 104) and torque the bolts to 125 N·m (92 ft. lbs.). Use the

80b46d26

Fig. 106 Installing Seal Into Cover With Tool 8281

- 3 - SEAL

80b46d27

Fig. 107 Installing Front Cover with Seal Pilot

- 1 - SEAL PILOT

engine barring tool to keep the engine from rotating during tightening operation.

(10) Install the fan support/hub assembly (Fig. 103) and torque bolts to 24 N·m (18 ft. lbs.).

(11) Install cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(12) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect battery negative cables.

(15) Start engine and check for oil leaks.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Remove the transmission and transfer case (if equipped).
- (3) Remove the clutch cover and disc (if manual transmission equipped) (Refer to 6 - CLUTCH/CLUTCH DISC - REMOVAL).
- (4) Remove the flywheel or converter drive plate.
- (5) Drill holes 180° apart into the seal. Be careful not to contact the drill against the crankshaft.
- (6) Install #10 sheet metal screws in the drilled holes and remove the rear seal with a slide hammer (Fig. 108).

Fig. 108 Crankshaft Rear Seal Removal

- 1 - NO. 10 SCREW
- 2 - REAR SEAL
- 3 - CRANKSHAFT
- 4 - SLIDE HAMMER

INSTALLATION

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal surfaces must be completely dry when the seal is installed. Use a soap and water solution on outside diameter of seal to ease assembly.

- (1) Clean the crankshaft journal with a suitable solvent and dry with a clean shop towel or compressed air. Wipe the inside bore of the crankshaft seal retainer with a clean shop towel.
- (2) Inspect the crankshaft journal for gouges, nicks, or other imperfections. If the seal groove in the crankshaft is excessively deep, install the new seal 1/8" deeper into the retainer bore, or obtain a crank-

shaft wear sleeve that is available in the aftermarket.

- (3) Install the seal pilot, provided in the replacement kit, onto the crankshaft.

- (4) Using the provided alignment/installation tool, start the seal over the pilot and into the retainer by hand.

- (5) Using a ball peen hammer, strike the tool at the 12, 3, 6, and 9 o'clock positions until the alignment tool bottoms out on the retainer (Fig. 109).

- (6) Remove the seal pilot.

Fig. 109 Seal Installation Using Alignment Tool and Hammer

- 1 - SEAL PILOT TOOL
- 2 - INSTALLATION TOOL
- 3 - SEAL
- 4 - RETAINER

- (7) Install the flywheel or converter drive plate. Tighten the bolts to 137 N·m (101 ft. lbs.) torque.

- (8) Install the clutch cover and disc (if equipped) (Refer to 6 - CLUTCH/CLUTCH DISC - INSTALLATION).

- (9) Install the transmission and transfer case (if equipped).

- (10) Lower vehicle.

- (11) Connect battery negative cables.

- (12) Check engine oil level and adjust, if necessary.

- (13) Start engine and check for oil leaks.

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

(3) Remove the oil pan drain plug and drain the engine oil. Re-install plug and torque to 60 N·m (44 ft. lbs.) torque.

(4) Remove transmission and transfer case (if equipped) from vehicle.

(5) Remove flywheel or torque converter drive plate.

(6) Disconnect starter cables from starter motor.

(7) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL) and transmission adapter plate assembly.

(8) Disconnect cables from starter motor.

(9) Remove the eight flywheel housing to block bolts and remove housing and starter motor as an assembly.

(10) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.

(11) Remove oil pan and suction tube (Fig. 110) (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

Fig. 110 Oil Pan, Suction Tube and Gasket

- 1 - GASKET
- 2 - SUCTION TUBE
- 3 - OIL PAN

(12) Remove the six (6) retainer-to-block bolts (Fig. 111).

(13) Remove the rear seal retainer and gasket (Fig. 111).

(14) Support the seal retainer and drive out the crankshaft seal with a hammer and suitable punch.

80b46d30

Fig. 111 Crankshaft Rear Seal Retainer and Gasket

- 1 - RETAINER
- 2 - GASKET
- 3 - BOLT

INSTALLATION

(1) If using the old seal retainer, it is recommended that the crankshaft seal is replaced. Support the seal retainer and drive out the old seal.

(2) Using the retainer alignment/seal installation tool provided in the seal service kit, install the alignment tool into the retainer and install to the cylinder block (Fig. 112), using a new gasket. Tighten the six (6) mounting bolts by hand.

80b4faac

Fig. 112 Aligning Seal Retainer with Alignment/Installation Tool

- 1 - ALIGNMENT / INSTALLATION TOOL
- 2 - SEAL RETAINER

(3) Starting with the center two bolts, tighten the retainer in a circular pattern to 9 N·m (80 in. lbs.). Remove the alignment tool.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal surfaces must be completely dry when the seal is installed. Use a soap and water solution on outside diameter of seal to ease assembly.

(4) Make sure the provided seal pilot is installed into the new crankshaft seal. Use the alignment/installation tool and press the seal onto the crankshaft (Fig. 113). Alternately drive the seal at the 12, 3, 6 and 9 o'clock positions.

Fig. 113 Installing Seal Using Alignment Tool and Hammer

- 1 - SEAL PILOT TOOL
- 2 - INSTALLATION TOOL
- 3 - SEAL
- 4 - RETAINER

(5) Remove the alignment tool and trim the retainer gasket even with the oil pan mounting surface (Fig. 114).

(6) Remove the seal pilot.

(7) Apply a small amount of Mopar® Silicone Rubber Adhesive Sealant to the oil pan rail T-joints.

(8) Install the oil pan, suction tube and gaskets (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(9) Install the flywheel housing and bolts. Tighten the bolts to 60 N·m (44 ft. lbs.) torque.

(10) Install the starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(11) Install the flywheel or converter drive plate. Tighten bolts to 137 N·m (101 ft. lbs.)

(12) Install the transmission and transfer case (if equipped).

(13) Lower vehicle.

(14) Fill the crankcase with new engine oil.

(15) Connect the battery negative cables.

(16) Start engine and check for oil leaks.

Fig. 114 Trimming Excess Gasket Material

- 1 - GASKET

SOLID LIFTERS/TAPPETS

REMOVAL

NOTE: This procedure requires use of Miller Tool 8502 Tappet Replacement Kit, or Cummins Tool Kit #3822513.

(1) Remove camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(2) Insert the trough (provided with tool kit) the full length of the camshaft bore (Fig. 115). Make sure the cap end goes in first and the open side faces up (towards tappets).

Fig. 115 Inserting the Trough

- 1 - TROUGH

SOLID LIFTERS/TAPPETS (Continued)

(3) **Remove only one tappet at a time.** Remove rubber band from one cylinder pair and attach tappet dowel not being removed to the next cylinder pair (Fig. 116).

(4) Raise dowel rod (disengage from tappet) and allow tappet to fall into trough (Fig. 117).

(5) Carefully remove trough (**do not rotate**) and tappet. If the tappet is not being replaced, mark it so it can be installed in its original location.

(6) Re-install trough and repeat procedure on remaining tappets.

80b4faa0

Fig. 116 Secure Dowel/Tappet to Adjacent Cylinder

80b4faa1

Fig. 117 Lift Dowel Rod to Disengage from Tappet

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSPECTION

(1) Visually inspect the tappet the tappet socket, stem, and face for excessive wear, cracks, or obvious damage (Fig. 118).

(2) Measure the tappet stem diameter. Replace the tappet if it falls below the minimum size (Fig. 118).

J9109-152

Fig. 118 Tappet Inspection

TAPPET STEM DIAMETER

15.925 mm (0.627 in.) MIN.

15.977 mm (0.629 in.) MAX.

INSTALLATION

(1) Insert the trough the full length of the camshaft bore (Fig. 115). Again, make sure the cap end goes in first and the open side faces up (towards tappets).

(2) Lower the tappet installation tool through the push rod hole (Fig. 119) and into the trough.

80b4faa2

Fig. 119 Insert Installation Tool through Push Rod Hole

(3) Retrieve the tappet installation tool using the hooked rod provided with the tool kit (Fig. 120).

(4) Lubricate the tappet with clean engine oil or suitable equivalent and install the tappet to the installation tool (Fig. 121).

(5) Pull the tappet up and into position (Fig. 121). If difficulty is experienced getting the tappet to make the turn into the tappet bore, wiggle the trough while **gently** pulling up on the tappet.

(6) With the tappet in place, rotate the trough one half turn so the open side is down (toward crankshaft) (Fig. 122).

SOLID LIFTERS/TAPPETS (Continued)

(7) Remove the tappet installation tool from the tappet.

(8) Re-install a dowel rod and secure the rod with a rubber band.

(9) Rotate the trough one half turn and repeat the procedure for the remaining tappets.

(10) Install the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - INSTALLATION).

80b4faa3

80b4faa4

Fig. 121 Insert Tool and Pull Tappet Into Place

PISTON & CONNECTING ROD

DESCRIPTION

The piston (Fig. 123) is constructed of aluminum and is gravity cast, free floating design. The piston incorporates a centrally located high swirl combustion bowl, and utilizes a "keystone" style top compression ring (Fig. 124), and a "Tapered Face" intermediate ring (Fig. 124), for superior cylinder wall scraping. Piston cooling nozzles cool the piston

80b4faa5

Fig. 122 Rotate Trough One Half Turn (180°)

and pin with engine oil supplied by the crankshaft main journals.

The connecting rods (Fig. 125) are a split angle design constructed of micro alloy. The rods have a pressed in place wrist pin bushing which is lubricated by the piston cooling nozzle oil spray.

80c41f5a

Fig. 123 Piston

STANDARD PROCEDURE—PISTON GRADING

- When rebuilding an engine with the original cylinder block, crankshaft and pistons, make sure the pistons are installed in their original cylinder.
- If replacing the piston(s), make sure the replacement piston(s) are the same grade as the one being replaced.

PISTON & CONNECTING ROD (Continued)

**Fig. 124 Piston Ring Identification****Fig. 125 Connecting Rod**

80c41f5b

• If a new cylinder block and/or crankshaft is used, the piston grading procedure **MUST** be performed to determine the proper piston grade for each cylinder.

(1) Install any of the original connecting rod and piston assemblies into the No.1 cylinder. DO NOT install the piston rings.

(2) Install the upper bearing shell in the connecting rod with the tang of the bearing in the slot of the connecting rod. The connecting rod bearing shell must be installed in the original connecting rod and cap. Use clean lubricating oil to coat the inside diameter of the connecting rod bearing shell.

(3) Install the bearing shell in the connecting rod cap with the tang of the bearing in the slot to the cap. Use clean lubricating oil to coat the inside diameter of the bearing shell.

(4) The four digit number stamped on the connecting rod and cap at the parting line must match and be installed on the oil cooler side of the engine. Install the connecting rod cap and cap screws. Tighten the cap screws to 35 N·m (26 ft. lbs.) torque.

(5) Use a fine grit stone to remove any burrs from the cylinder block head deck. Zero the dial indicator to the cylinder block head deck.

(6) Move the dial indicator directly over the piston pin to eliminate any side-to-side movement.

(7) Rotate the crankshaft to top dead center (TDC). Rotate the crankshaft clockwise and counter-clockwise to find the highest dial indicator reading. Record the reading.

(8) Remove the piston and connecting rod assembly from the No.1 cylinder and install the assembly into the No.2 cylinder. Repeat the procedure for every cylinder using the same piston and connecting rod assembly.

(9) Determine the grade of the piston being used by referring to the Piston Protrusion Chart below. Four digits on top of the piston can be cross referenced to a DaimlerChrysler part number for replacement (Fig. 126). If the number on the piston cannot be seen, measure from the top of the piston to the top of the piston pin to see what grade piston is used (Fig. 127).

**Fig. 126 Piston Grading Number Location**

J9509-2

NOTE: NEVER INTERMIX PISTONS FROM ONE ENGINE APPLICATION TO ANOTHER ENGINE APPLICATION. SEVER DRIVEABILITY CONCERNS MAY RESULT.

PISTON & CONNECTING ROD (Continued)

PISTON & CONNECTING ROD (Continued)

80a82c90

Fig. 127 Piston Grading Measurement**REMOVAL**

- (1) Disconnect the battery cables.
- (2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
- (3) Remove the oil pan and suction tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (4) Using Miller Tool 7471-B crankshaft barring tool, rotate the crankshaft so all of the pistons are below TDC.
- (5) Before removing the piston(s) from the bore(s):
 - (a) Remove any carbon ridge formations or deposits at the top of the bore with a dull scraper or soft wire brush.
 - (b) If cylinder bore wear ridges are found, use a ridge reamer to cut the ridge from the bore. DO NOT remove more metal than necessary to remove the ridge.

NOTE: If cylinders have ridges, the cylinders are oversize and will more than likely need boring.

- (6) Using a hammer and steel stamp, identify the front of the piston by stamping the cylinder number in each piston to be removed at the top of the piston toward the front of the engine. DO NOT stamp in the outside 5 mm (.197 in.) of the piston diameter.

- (7) Mark the connecting rod and cap with the corresponding cylinder numbers.

- (8) Remove the connecting rod bolts and rod caps. Use care so the cylinder bores and connecting rods are not damaged.

- (9) Use a hammer handle or similar object to push the piston and connecting rod through the cylinder bore.

- (10) Store the piston/rod assemblies in a rack.

- (11) If a piston must be replaced, replace with the same part number (grading) that was removed.

CLEANING

CAUTION: DO NOT use bead blast to clean the pistons. DO NOT clean the pistons and rods in an acid tank.

Clean the pistons and pins in a suitable solvent, rinse in hot water and blow dry with compressed air. Soaking the pistons over night will loosen most of the carbon build up. De-carbon the ring grooves with a broken piston ring and again clean the pistons in solvent. Rinse in hot water and blow dry with compressed air.

INSPECTION

Inspect the pistons for damage and excessive wear. Check top of the piston, ring grooves, skirt and pin bore. Measure the piston skirt diameter (Fig. 128). If the piston is out of limits, replace the piston.

The upper groove only needs to be inspected for damage. Use a new piston ring to measure the clearance in the intermediate ring groove (Fig. 129). If the clearance of the intermediate ring exceeds 0.095 mm (0.0038 inch), replace the piston.

Use a new oil ring to measure the clearance in the oil groove (Fig. 129). If the clearance exceeds 0.085 mm (0.0034 inch), replace the piston.

Measure the pin bore (Fig. 130). The maximum diameter is 40.012 mm (1.5753 inch). If the bore is over limits, replace the piston.

Inspect the piston pin for nicks, gouges and excessive wear. Measure the pin diameter (Fig. 131). The minimum diameter is 39.990 mm (1.5744 inch). If the diameter is out of limits, replace the pin.

PISTON & CONNECTING ROD (Continued)

Connecting Rods

CLEANING

Clean the connecting rods in a suitable solvent, rinse in hot water and blow dry with compressed air.

1 - CONNECTING ROD

PISTON & CONNECTING ROD (Continued)

INSTALLATION

(1) Lubricate the cylinder bores with clean engine oil.

(2) Generously lubricate the rings and piston skirts with clean engine oil.

(3) Compress the rings using a piston ring compressor tool (Fig. 133). If using a strap-type ring compressor, make sure the inside end of the strap does not hook on a ring gap and break the ring.

Fig. 133 Piston Ring Compressor Tool

1 - PISTON RING COMPRESSOR TOOL

(4) Bar the crankshaft so the rod journal for the piston to be installed is at BDC (Bottom Dead Center) - (Fig. 134).

Fig. 134 Piston/Rod Assembly at BDC

(5) Be sure the mark you made on the piston and the numbers on the rod and cap are oriented as illustrated.

(6) Position the piston and rod assembly into the cylinder bore with the mark you made on the piston towards the front of the cylinder block. In this position the numbers on the connecting rod should be facing the oil cooler side of the engine, and the rod bolt holes toward the camshaft. Use care when you install the piston and connecting rod so the cylinder bore is not damaged.

(7) Push the piston into the bore until the top of the piston is approximately 50 mm (2 inch) below the

top of the block. Carefully pull the connecting rod onto the crankshaft journal.

(8) Use clean engine oil to lubricate the threads and under the heads of the connecting rod bolts.

(9) The number stamped on the rod cap at the parting line must match and be installed towards the oil cooler side of the engine (Fig. 135).

Fig. 135 Correct Rod Cap Installation

(10) Install the rod cap and bolts to the connecting rod. Tighten the connecting rod and bolt evenly in 3 steps.

- Tighten the bolts to 35 N·m (26 ft. lbs.) torque.
- Tighten the bolts to 70 N·m (51 ft. lbs.) torque.
- Tighten the bolts to 100 N·m (73 ft. lbs.) torque.

(11) The crankshaft must rotate freely. Check for freedom of rotation as the caps are installed. If the crankshaft does not rotate freely, check the installation of the rod bearing and the bearing size.

(12) Measure the side clearance between the connecting rod and the crankshaft (Fig. 136). DO NOT measure the clearance between the cap and crankshaft.

Fig. 136 Side Clearance between Connecting Rod/Crankshaft

1 - FEELER GAUGE

CONNECTING ROD SIDE CLEARANCE 0.1 - 0.33 mm (.004 - .013 inch)

PISTON & CONNECTING ROD (Continued)

(13) Install the suction tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Install the cylinder head onto the engine (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(15) Install a new filter and fill the crankcase with new engine oil.

(16) Connect the battery negative cables and start engine.

PISTON RINGS

STANDARD PROCEDURE-PISTON RING FITTING

(1) Determine the piston diameter and obtain the appropriate ring set. The piston rings can be identified as shown in (Fig. 137).

Fig. 137 Piston Ring Identification

(2) Position each ring in the cylinder and use a piston to square it with the bore at a depth of 89.0 mm (3.5 inch) - (Fig. 138).

Fig. 138 Position of Ring in Cylinder Bore

- 1 - PISTON
- 2 - CYLINDER BORE
- 3 - DEPTH

(3) Use a feeler gauge to measure the piston ring gap.

PISTON RING GAP CHART		
TOP RING	0.35 - 0.45 mm	(0.014 - 0.0177 in.)
INTERMEDIATE RING	0.85-1.15 mm	(0.0334 - 0.0452 in.)
OIL CONTROL RING	0.250-0.550 mm	(0.0100 - 0.0215 in.)

(4) The top surface of all of the rings are identified with the word TOP or the supplier's MARK. Assemble the rings with the word TOP or the supplier's MARK up.

(5) Position the oil ring expander in the oil control ring groove (bottom groove).

(6) Install the oil control ring with the end gap OPPOSITE the ends on the expander (Fig. 139).

Fig. 139 Oil Control Ring/Expander Location in Groove

- 1 - OIL CONTROL RING
- 2 - EXPANDER
- 3 - PISTON

(7) Install the intermediate piston ring in the second groove.

(8) Install the top piston ring in the top groove (Fig. 140).

Fig. 140 Piston Ring Installation Tool

VIBRATION DAMPER

REMOVAL

(1) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove the four (4) damper to crankshaft bolts and remove damper (Fig. 142).

Fig. 142 Crankshaft Damper Removal/Installation

- 1 - DAMPER
- 2 - BOLT

INSPECTION

(1) Inspect the damper hub for cracks and replace if any are found.

(2) Inspect the index lines on the damper hub and the inertia member (Fig. 143). If the lines are more than 1.59 mm (1/16 in.) out of alignment, replace the damper.

(3) Inspect the rubber member for deterioration or missing segments (Fig. 144).

80b46d34

Fig. 143 Inspect Index Lines for Alignment

- 1 - INDEX LINES
- 2 - HUB
- 3 - INERTIA MEMBER

80b46d32

Fig. 144 Inspect Damper Rubber Member

INSTALLATION

(1) Install the crankshaft damper and bolts (Fig. 142). Tighten bolts to 125 N·m (92 ft. lbs.) torque.

(2) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

FRONT MOUNT

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Remove the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (3) Raise vehicle on hoist.
- (4) Support engine with a screw jack and wood block.
- (5) Loosen the thru-bolt and nut (Fig. 145).
- (6) Passenger side mount: Remove the two (2) transmission oil cooler bracket to engine mount bolts.
- (7) Lift the engine SLIGHTLY and remove the four (4) mount to block bolts.
- (8) Remove the mount from the vehicle.

Fig. 145 Front Engine Mount—Typical

- 1 - MOUNT
2 - BOLT (4)

INSTALLATION

- (1) With engine raised SLIGHTLY, position the engine mount to the block. Install the bolts and tighten to 149 N·m (110 ft. lbs.) torque.
- (2) Install the thru-bolt into the engine mount.
- (3) Lower the engine while guiding the mount and thru-bolt into the frame mounted support cushion brackets (Fig. 146).

J9409-122

Fig. 146 Positioning Engine Front Mounts

- 1 - ENGINE SUPPORT BRACKET/CUSHION
2 - SUPPORT CUSHION BRACKET

- (4) Install the thru-bolt nut and tighten the nut to 88 N·m (65 ft. lbs.) torque.
- (5) Passenger side: Install the two (2) transmission oil cooler bracket to mount bolts. Tighten the bolts to 47 N·m (35 ft. lbs.) torque.
- (6) Remove lifting fixture.
- (7) Lower the vehicle.
- (8) Install the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
- (9) Connect the battery negative cables.

REAR MOUNT

REMOVAL

- (1) Raise the vehicle on a hoist.
- (2) Position a transmission jack in place.
- (3) Remove support cushion stud nuts (Fig. 147).
- (4) Raise rear of transmission and engine SLIGHTLY.
- (5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.
- (6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

- (1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.
- (2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.
- (3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 50).
- (4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.
- (5) Remove the transmission jack.
- (6) Lower the vehicle.

J9509-126

Fig. 147 Engine Rear Support Cushion Assembly

LUBRICATION

DESCRIPTION

NOTE: Refer to (Fig. 148) and (Fig. 149) for circuit illustrations.

A gear driven gerotor type oil pump is mounted behind the front gear cover in the lower right portion on the engine.

OPERATION

A gerotor style oil pump draws oil from the crankcase through the suction tube and delivers it through the block where it enters the oil cooler cover and pressure regulator valve. When oil pressure exceeds 449 kPa (65 PSI), the valve opens exposing the dump port, which routes excess oil back to the oil sump.

At the same time, oil is directed to a cast in passage in the oil cooler cover, leading to the oil cooler element. As the oil travels through the element plates, it is cooled by engine coolant traveling past the outside of the plates. It is then routed to the oil filter head and through a full flow oil filter. If a plugged filter is encountered, the filter by-pass valve opens, allowing unfiltered oil to lubricate the engine. This condition can be avoided by frequent oil and filter changes, per the maintenance schedules found in the owners manual. The by-pass valve is calibrated to open when it sees a pressure drop of more than 344 kPa (50 psi) across the oil filter.

The oil filter head then divides the oil between the engine and the turbocharger. The turbocharger receives filtered, cooled and pressurized oil through a supply line from the filter head. The oil lubricates the turbocharger and returns to the pan by way of a drain tube connecting the bottom of the turbocharger to a pressed in tube in the cylinder block.

Oil is then carried across the block to an angle drilling which intersects the main oil rifle. The main oil rifle runs the length of the block and delivers oil to the crankshaft main journals and valve train. Oil travels to the crankshaft through a series of transfer drillings (one for each main bearing) and lubricates a groove in the main bearing upper shell. From there another drilling feeds the camshaft main journals. The piston cooling nozzles are also supplied by the main bearing upper shell. Crankshaft internal cross-drillings supply oil to the connecting rod journals.

Another series of transfer drillings intersecting the main oil rifle supply the valve train components. Oil travels up the drilling, through a hole in the head gasket, and through a drilling in the cylinder head (one per cylinder), where it enters the rocker arm pedestal and is divided between the intake and exhaust rocker arm. Oil travels up and around the rocker arm mounting bolt, and lubricates the rocker shaft by cross drillings that intersect the mounting bolt hole. Grooves at both ends of the rocker shaft supply oil through the rocker arm where the oil travels to the push rod and socket balls (Fig. 148) and (Fig. 149).

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

- (1) Remove the engine oil pressure sensor and install Oil Pressure Line and Gauge Tool C-3292 with a suitable adapter.
- (2) Start engine and warm to operating temperature.
- (3) Record engine oil pressure and compare with engine oil pressure chart.

CAUTION: If engine oil pressure is zero at idle, DO NOT RUN THE ENGINE.

Engine Oil Pressure (MIN)	
At Idle	103.4 kPa (15 psi)
At 2000 rpm	310.2 kPa (45 psi)

If minimum engine oil pressure is below these ranges, (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

- (4) Remove oil pressure gauge and install the oil pressure sensor. Tighten the sensor to 16 N·m (144 in. lbs.) torque.

OIL

STANDARD PROCEDURE-ENGINE OIL LEVEL

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable oil level is in the SAFE RANGE on the engine oil dipstick (Fig. 150).

Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level of a cold engine is not accurate.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.

80a82c95

Fig. 150 Oil Level Indicator (Dipstick)

- 1 - ADD OIL MARK
- 2 - O-RING
- 3 - SAFE RANGE

- (4) Replace dipstick and verify it is seated in the tube.

- (5) Remove dipstick, with handle held above the tip, take oil level reading.

- (6) Add oil only if level is below the SAFE RANGE area on the dipstick.

- (7) Replace dipstick

STANDARD PROCEDURE-ENGINE OIL SERVICE

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

NOTE: Change engine oil and filter at intervals specified in the owner's manual.

- (1) Operate the engine until the water temperature reaches 60°C (140°F). Shut the engine off.

- (2) Use a container that can hold at least 14 liters (15 quarts) to hold the used oil. Remove the oil drain plug and drain the used engine oil into the container.

- (3) Always check the condition of the used oil. This can give you an indication of engine problems that might exist.

- Thin, black oil indicates fuel dilution.

OIL (Continued)

- Milky discoloration indicates coolant dilution.
- (4) Clean the area around the oil filter head. Remove the filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
- (5) Install new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
- (6) Clean the drain plug and the sealing surface of the pan. Check the condition of the threads and sealing surface on the oil pan and drain plug.
- (7) Install the drain plug. Tighten the plug to 60 N·m (44 ft. lbs.) torque.
- (8) Use only High-Quality Multi-Viscosity lubricating oil in the Cummins Turbo Diesel engine. Choose the correct oil for the operating conditions (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
- (9) Fill the engine with the correct grade of new oil (Refer to LUBRICATION & MAINTENANCE/FLUID CAPACITIES - SPECIFICATIONS).
- (10) Start the engine and operate it at idle for several minutes. Check for leaks at the filter and drain plug.
- (11) Stop engine. Wait several minutes to allow the oil to drain back to the pan and check the level again.

USED ENGINE OIL DISPOSAL Care should be exercised when disposing of used engine oil after it has been drained from a vehicle's engine.

OIL COOLER & LINES

CLEANING AND INSPECTION

Clean the sealing surfaces.

Apply 483 kPa (70 psi) air pressure to the element to check for leaks. If the element leaks, replace the element.

OIL FILTER

REMOVAL

- (1) Clean the area around the oil filter head. Remove the filter using a 90-95 mm filter wrench.
- (2) Clean the gasket surface of the filter head. The filter canister O-Ring seal can stick on the filter head. Make sure it is removed.

INSTALLATION

- (1) Fill the oil filter element with clean oil before installation. Use the same type oil that will be used in the engine.
- (2) Apply a light film of lubricating oil to the sealing surface before installing the filter.

CAUTION: Mechanical over-tightening may distort the threads or damage the filter element seal.

- (3) Install the filter until it contacts the sealing surface of the oil filter adapter. Tighten filter an additional ½ turn.

OIL PAN

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Remove transmission and transfer case (if equipped).
- (4) Remove flywheel.
- (5) Disconnect starter cables from starter motor.
- (6) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL) and transmission adapter plate assembly.

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

- (7) Drain the engine oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).
- (8) Install the oil pan drain plug with a new sealing washer and tighten to 60 N·m (44 ft. lbs.) torque.
- (9) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.
- (10) Remove oil pan and suction tube (Fig. 151).

80b46d35

Fig. 151 Oil Pan, Suction Tube and Gasket

- 1 - GASKET
- 2 - SUCTION TUBE
- 3 - OIL PAN

OIL PAN (Continued)

CLEANING

Remove all gasket material from the oil pan and cylinder block sealing surfaces. Extra effort may be required around T-joint areas. Clean oil pan and flush suction tube with a suitable solvent.

INSPECTION

Inspect the oil pan, suction tube, and tube braces for cracks and damage. Replace any defective component. Inspect the oil drain plug and drain hole threads. Inspect the oil pan sealing surface for straightness. Repair any minor imperfections with a ball-peen hammer. Do not attempt to repair an oil pan by welding.

INSTALLATION

(1) Fill the T-joint between the pan rail/gear housing and pan rail/rear seal retainer with sealant. Use Mopar® Silicone Rubber Adhesive Sealant or equivalent.

(2) Place suction tube in oil pan and guide them into place (Fig. 151). Using a new tube to oil pump gasket, install and tighten the suction tube bolts by hand. Starting with the oil pump inlet bolts, tighten the bolts to 24 N·m (18 ft. lbs.) torque. Tighten the remaining tube brace bolts to 24 N·m (18 ft. lbs.) torque.

(3) Starting in the center and working outward, tighten the oil pan bolts to 24 N·m (18 ft. lbs.) torque.

(4) Install the flywheel housing assembly with the starter motor attached and tighten bolts to 60 N·m (44 ft. lbs.) torque.

(5) Connect starter motor cables.

(6) Install transmission and transfer case (if equipped).

(7) Lower vehicle.

(8) Install battery negative cables.

(9) Fill the crankcase with new engine oil.

(10) Start engine and check for leaks. Stop engine, check oil level, and adjust, if necessary.

OIL PRESSURE RELIEF VALVE

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the threaded plug, spring and plunger (Fig. 152). Insert a finger or a seal pick to lift the plunger from the bore.

NOTE: If the plunger is stuck in the bore, it will be necessary to remove the filter head.

J9109-14

Fig. 152 Oil Pressure Regulator

- 1 - OIL FILTER
- 2 - PLUG
- 3 - GASKET
- 4 - SPRING
- 5 - VALVE

CLEANING

(1) Clean the regulator spring and plunger with a suitable solvent and blow dry with compressed air. If the plunger bore requires cleaning, it is necessary to remove the oil filter head to avoid getting debris into the engine.

INSPECTION

Inspect the plunger and plunger bore for cracks and excessive wear. Polished surfaces are acceptable. Verify that the plunger moves freely in the bore.

Check the spring for height and load limitations (Fig. 153). Replace the spring if out of limits shown in the figure.

VALVE OPEN

- HEIGHT: 41.25mm (1.62 inch)
- LOAD: 126 N (28.4 lb)

FREE LENGTH: 66mm (2.6 inch)

J9509-161

Fig. 153 Oil Pressure Regulator Spring Check

OIL PRESSURE RELIEF VALVE (Continued)

INSTALLATION

(1) Install the plunger, spring, and plug as shown in (Fig. 152). Tighten the plug to 80 N·m (60 ft. lbs.) torque.

(2) Connect the battery negative cables.

(3) Start the engine and verify that it has oil pressure.

OIL PRESSURE SENSOR/
SWITCH

DESCRIPTION

The 3-wire, solid-state oil pressure sensor is installed into the oil pressure galley on the engine block. It is located below and to the rear of the Engine Control Module (ECM) (Fig. 154).

Fig. 154 Oil Pressure Sensor (Engine) Location

- 1 - ENGINE OIL PRESSURE SENSOR
- 2 - ELECTRICAL CONNECTOR
- 3 - ECM

OPERATION

Operation of the oil pressure sensor on the diesel engine is controlled by the Engine Control Module (ECM). The Powertrain Control Module (PCM) does not have any control over the sensor.

The oil pressure sensor uses three circuits. They are:

- A 5-volt power supply from the ECM
- A sensor ground through the ECM's sensor return
- A signal to the ECM relating to engine oil pressure

The oil pressure sensor has a 3-wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor on the gasoline powered engine. Meaning different pressures relate to different output voltages.

A 5-volt supply is sent to the sensor from the ECM to power up the sensor. The sensor returns a voltage signal back to the ECM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on the CCD bus circuit to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the ECM through a low-noise sensor return.

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Disconnect the oil pressure sensor connector (Fig. 155).
- (3) Using a suitable socket, remove the oil pressure sensor from the block (counter-clockwise).

Fig. 155 Oil Pressure Sensor Location

- 1 - ENGINE OIL PRESSURE SENSOR
- 2 - ELECTRICAL CONNECTOR
- 3 - ECM

OIL PRESSURE SENSOR/SWITCH (Continued)

INSTALLATION

- (1) If the sensor is not being replaced, inspect the o-ring (Fig. 156) and replace if necessary.
- (2) Install the oil pressure sensor and tighten to 16 N·m (144 in. lbs.) torque.
- (3) Connect the battery negative cables.
- (4) Start engine and check for oil leaks at the sensor.

80b46b94

Fig. 156 Oil Pressure Sensor and

- 1 - ENGINE OIL PRESSURE SENSOR
2 - O-RING

OIL PUMP

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Remove fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (4) Remove the fan support/hub assembly.
- (5) Remove crankshaft damper (Fig. 157) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (6) Remove the gear housing cover (Fig. 158) (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - REMOVAL).
- (7) Remove the four mounting bolts and pull the pump from the bore in the cylinder block (Fig. 159).

CLEANING

Clean all parts in solvent and dry with compressed air. Clean the old sealer residue from the back of the gear housing cover and front of the gear housing.

80b46d29

Fig. 157 Crankshaft Damper Removal/Installation

- 1 - DAMPER
2 - BOLT

J9209-157

Fig. 158 Gear Housing and Cover

- 1 - GEAR HOUSING
2 - GEAR HOUSING COVER

INSPECTION

Disassemble and inspect the oil pump as follows:

- (1) Visually inspect the lube pump gears for chips, cracks or excessive wear.
- (2) Remove the back plate (Fig. 160).
- (3) Mark TOP on the gerotor planetary using a felt tip pen (Fig. 160).
- (4) Remove the gerotor planetary (Fig. 160). Inspect for excessive wear or damage. Inspect the pump housing and gerotor drive for damaged and excessive wear.
- (5) Install the gerotor planetary in the original position. The chamfer must be on the O.D. and down.

OIL PUMP (Continued)

**Fig. 159 Oil Pump Removal/Installation**

- 1 - OIL PUMP
2 - BOLT (4)

(6) Measure the tip clearance (Fig. 161). Maximum clearance is 0.1778 mm (0.007 inch). If the oil pump is out of limits, replace the pump.

(7) Measure the clearance of the gerotor drive/gerotor planetary to port plate (Fig. 162). Maximum clearance is 0.127 mm (0.005 inch). If the oil pump is out of limits, replace the pump.

(8) Measure the clearance of the gerotor planetary to the body bore (Fig. 163). Maximum clearance is 0.381 mm (0.015 inch). If the oil pump is out of limits, replace the pump.

(9) Measure the gears backlash (Fig. 164). The limits of a used pump is 0.075- 0.85 mm (0.0296-0.0335 inch). If the backlash is out of limits, replace the oil pump.

(10) Install the back plate.

INSTALLATION

(1) Lubricate the pump with clean engine oil. Filling the pump with clean engine oil during installation will help to prime the pump at engine start up.

(2) Verify the idler gear pin is installed in the locating bore in the cylinder block.

(3) Install the pump (Fig. 159). Tighten the oil pump mounting bolts in two steps, in the sequence shown in (Fig. 165).

- Step 1—Tighten to 5 N·m (44 in. lbs.) torque.
- Step 2—Tighten to 24 N·m (18 ft. lbs.) torque.

(4) The back plate on the pump seats against the bottom of the bore in the cylinder block. When the pump is correctly installed, the flange on the pump will not touch the cylinder block.

(5) Measure the idler gear to pump drive gear backlash and the idler gear to crankshaft gear backlash (Fig. 166). The backlash should be 0.75- 0.85

**Fig. 160 Gerotor Planetary and Gerotor**

- 1 - OIL PUMP BACK PLATE

Fig. 165 Oil Pump Mounting Bolt Torque Sequence

(7) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

Fig. 166 Idler Gear to Pump Drive Gear and Crankshaft Gear Backlash

(8) Install the gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - INSTALLATION).

(9) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(10) Install the fan support/hub assembly and torque bolts to 24 N·m (18 ft. lbs.).

(11) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install the cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(13) Connect battery negative cables.

(14) Start engine and check for oil leaks.

INTAKE MANIFOLD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the charge air cooler outlet tube from the air inlet housing (Fig. 167).

(3) Remove the engine oil dipstick tube mounting bolt (Fig. 167). Position dipstick tube to the side.

(4) Disconnect the air grid heater power cables at the cable mounting studs (Fig. 168).

(5) Remove the four (4) air inlet housing mounting bolts (Fig. 168) and remove the housing from top of the heater elements.

(6) Remove the intake air grid heater from the manifold (Fig. 169).

(7) Remove the high pressure fuel lines.(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - REMOVAL).

(8) Remove the remaining intake manifold cover-to-cylinder head bolts.

(9) Remove the intake manifold cover and gasket. Keep the gasket material and any other material out of the air intake.

(10) Clean the intake manifold cover and cylinder head sealing surface.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INSTALLATION

(1) Using a new gasket, install the intake manifold cover.

(2) Install the cover-to-cylinder head bolts that do not hold down the high pressure fuel line support brackets. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Install the high pressure fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - INSTALLATION).

**Fig. 169 Intake Air Grid Heater**

- 1 - AIR HEATER ELEMENTS
- 2 - LOWER GASKET
- 3 - BLOCK
- 4 - UPPER GASKET

(4) Install the high pressure fuel line support bracket-to-intake manifold cover bolts and tighten to 24 N·m (18 ft. lbs.) torque.

INTAKE MANIFOLD (Continued)

(5) Using two (2) new gaskets, install the intake air grid heater and air inlet housing (Fig. 168). Position the ground cable and install and tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(6) Install and tighten the air intake heater power supply nuts to 14 N·m (120 in. lbs.) torque.

(7) Install the engine oil dipstick tube and mounting bolt (Fig. 167).

(8) Position the charge air cooler outlet tube onto the air inlet housing (Fig. 167). Tighten the clamps to 8 N·m (72 in. lbs.) torque.

(9) Perform the fuel system air bleed procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(10) Connect the battery negative cables.

EXHAUST MANIFOLD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Disconnect the exhaust pipe from the turbocharger elbow (Fig. 170).

(4) Lower vehicle.

(5) Disconnect the turbocharger air inlet hose (Fig. 171).

(6) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 172).

J9411-18

Fig. 170 Exhaust Pipe

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER EXHAUST PIPE

(7) Disconnect the charge air cooler inlet pipe from the turbocharger (Fig. 172).

(8) Remove the turbocharger and gasket from the exhaust manifold.

(9) Remove the cab heater return pipe nut from the exhaust manifold stud. Position the tube out of the way.

J9511-7

EXHAUST MANIFOLD (Continued)

(10) Remove the exhaust manifold-to-cylinder head bolts and spacers (Fig. 173).

(11) Remove the exhaust manifold and gaskets (Fig. 173).

80b5cc58

Fig. 173 Exhaust Manifold and Gaskets

CLEANING

Clean the cylinder head and exhaust manifold sealing surfaces with a suitable scraper. Use a Scotch-Brite™ pad or equivalent.

INSPECTION

Inspect the exhaust manifold for cracks. Measure the exhaust manifold for flatness. Place a ruler over all of the exhaust ports and insert a feeler gauge between the port flange and the ruler.

INSTALLATION

(1) Using new gaskets, install the exhaust manifold and gaskets. Install the bolts and spacers and tighten the bolts in the sequence shown in (Fig. 173) to 43 N·m (32 ft. lbs.) torque.

(2) Install the cab heater return hose to the manifold bolt stud. Tighten the nut to 24 N·m (18 ft. lbs.) torque.

(3) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(4) Install the oil drain tube and oil supply line to the turbocharger. Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

(5) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Rotate the turbocharger impeller by hand to distribute the oil thoroughly.

(6) Install and tighten the oil supply line fitting nut to 20 N·m (133 in. lbs.) torque.

(7) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(8) Position the air inlet hose to the turbocharger (Fig. 171). Tighten the clamp to 8 N·m (72 in. lbs.) torque.

(9) Raise vehicle on hoist.

(10) Connect the exhaust pipe to the turbocharger (Fig. 170) and tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(11) Lower the vehicle.

(12) Connect the battery negative cables.

(13) Start the engine to check for leaks.

GEAR HOUSING

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove the oil pan and suction tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Lower vehicle.

(6) Remove radiator upper hose.

(7) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(8) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(9) Remove the fan shroud-to-radiator mounting bolts.

(10) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(11) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(12) Remove the cooling fan support/hub from the front of the engine (Fig. 174).

(13) Raise the vehicle on hoist.

(14) Remove the crankshaft damper (Fig. 175) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(15) Lower the vehicle.

GEAR HOUSING (Continued)

(16) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing (Fig. 176), taking care not to mar the gasket surfaces.

80b46d24

(21) Clean the gasket material from the cylinder block.

80b46d28

Fig. 177 Gear Housing and Gasket

- 1 - DOWEL
2 - GASKET
3 - BOLT
4 - GEAR HOUSING

INSTALLATION

(1) Install a new gasket and the gear housing (Fig. 177). Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(2) Connect the camshaft position sensor connector.

GEAR HOUSING (Continued)

(3) Install the injection pump (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - INSTALLATION).

(4) Install the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - INSTALLATION). Align the crankshaft, camshaft, and injection pump gear marks as shown in (Fig. 178).

80b4fa34

Fig. 178 Camshaft/Crankshaft Gear Alignment

(5) If a new housing is installed, the camshaft position sensor must be transferred to the new housing.

(6) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the crankshaft front oil seal.

(7) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(8) Using the seal pilot to align the cover (Fig. 179), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(9) Remove the seal pilot.

(10) Raise the vehicle.

(11) Trim any excess gear housing gasket to make it flush with the oil pan rail.

(12) Using a new gasket, install the oil pan and suction tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(13) Install the crankshaft damper (Fig. 175) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(14) Lower vehicle.

(15) Install the fan support/hub assembly (Fig. 174) and tighten bolts to 24 N·m (18 ft. lbs.) torque.

80b46d27

Fig. 179 Installing Cover with Seal Pilot

1 - SEAL PILOT

(16) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(17) Install the cooling fan and shroud together (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(18) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(19) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(20) Install the radiator upper hose and clamps.

(21) Add engine oil.

(22) Add coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(23) Connect the battery cables.

(24) Start engine and inspect for leaks.

GEAR HOUSING COVER

REMOVAL

(1) Disconnect both battery negative cables.

(2) Raise vehicle on hoist.

(3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Lower vehicle.

(5) Remove radiator upper hose.

(6) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(8) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

GEAR HOUSING COVER (Continued)

(9) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Remove the cooling fan support/hub from the front of the engine (Fig. 180).

(11) Raise the vehicle on hoist.

(12) Remove the crankshaft damper (Fig. 181) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(13) Lower the vehicle.

(14) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.

INSTALLATION

(1) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the seal.

(2) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(3) Using the seal pilot to align the cover (Fig. 183), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

80b46d27

Fig. 183 Installing Cover with Seal Pilot

- 1 - SEAL PILOT

- (4) Remove the seal pilot.
(5) Raise the vehicle.
(6) Install the crankshaft damper (Fig. 181) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(7) Lower vehicle.

GEAR HOUSING COVER (Continued)

(8) Install the fan support/hub assy. (Fig. 180) and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(9) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(10) Install the cooling fan and shroud together (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(11) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(12) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(13) Install the radiator upper hose and clamps.

(14) Add coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(15) Connect the battery cables.

(16) Start engine and inspect for leaks.

EXHAUST SYSTEM

DESCRIPTION—3.9L/5.2L/5.9/8.0L

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust sys-

tem floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

EXHAUST SYSTEM (Continued)

The federal gasoline engine exhaust system (Fig. 1) consists of engine exhaust manifolds, exhaust pipes, catalytic converter(s), extension pipe (if needed), exhaust heat shields, muffler and exhaust tailpipe.

The California emission vehicles exhaust system also contains the above components as well as mini catalytic converters added to the exhaust pipe (Fig. 2).

The exhaust system must be properly aligned to prevent stress, leakage and body contact. Minimum clearance between any exhaust component and the body or frame is 25.4 mm (1.0 in.). If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

DESCRIPTION—5.9L DIESEL

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, exhaust pipe, resonator, extension pipe (if needed), muffler and exhaust tailpipe.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. The exhaust components should be kept a minimum of 25.4 mm (1.0 in.) away from the body and frame. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

EXHAUST SYSTEM (Continued)

DIAGNOSIS AND TESTING - GAS ENGINE

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints. 2. Rusted or blown out muffler. 3. Broken or rusted out exhaust pipe. 4. Exhaust pipe leaking at manifold flange. 5. Exhaust manifold cracked or broken. 6. Leak between exhaust manifold and cylinder head. 7. Catalytic converter rusted or blown out. 8. Restriction in exhaust system.	1. Tighten clamps/bolts at leaking joints. 2. Replace muffler. Inspect exhaust system. 3. Replace exhaust pipe. 4. Tighten/replace flange attaching nuts/bolts. 5. Replace exhaust manifold. 6. Tighten exhaust manifold to cylinder head bolts. 7. Replace catalytic converter assy. 8. Remove restriction, if possible. Replace restricted part if necessary.
caution: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.

CATALYTIC CONVERTER - 3.9L/5.2L/5.9L

DESCRIPTION

The stainless steel catalytic converter is located under the vehicle, integral to the exhaust pipe(s).

OPERATION

The catalytic converter captures and burns any unburned fuel mixture exiting the combustion chambers during the exhaust stroke of the engine. This process aids in reducing emissions output.

REMOVAL

- (1) Raise and support vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove clamps and nuts (Fig. 3) (Fig. 4).

Fig. 3 Catalytic Converter and Exhaust Pipe 3.9L, 5.2L and 5.9L Light Duty (Federal)

- 1 - BOLT
- 2 - EXHAUST PIPE W/CONVERTER
- 3 - NUT
- 4 - RETAINER

- (4) Remove the catalytic converter.

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

INSTALLATION

- (1) Assemble converter and clamps loosely in place.

CATALYTIC CONVERTER - 3.9L/5.2L/5.9L (Continued)

- 3 - EXHAUST MANIFOLD
- 4 - NUT
- 5 - MINI CATALYTIC CONVERTER
- 6 - CATALYTIC CONVERTER WITH PIPES

(2) Install the exhaust pipe onto exhaust manifold, tighten 31 N·m (23 ft. lbs.).

(3) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

CATALYTIC CONVERTER - 5.9L HEAVY DUTY/8.0L

DESCRIPTION

The stainless steel catalytic converter is located under the vehicle, attached to the exhaust pipe(s).

OPERATION

The catalytic converter captures and burns any unburned fuel mixture exiting the combustion chambers during the exhaust stroke of the engine. This process aids in reducing emissions output.

REMOVAL

- (1) Raise and support vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove clamps and nuts (Fig. 5) (Fig. 6).

- (4) Remove the catalytic converter.

CATALYTIC CONVERTER - 5.9L HEAVY DUTY/8.0L (Continued)

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

INSTALLATION

(1) Assemble converter and clamps loosely in place.

(2) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.

(3) Lower the vehicle.

(4) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

**EXHAUST PIPE - 3.9L/5.2L/
5.9L****REMOVAL**

(1) Raise and support the vehicle.

(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Remove exhaust pipe to manifold bolts, retainers and nuts (Fig. 7).

(4) Remove the clamp nuts (Fig. 7).

(5) Remove the exhaust pipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with orig-

- 1 - EXHAUST PIPE WITH CATALYTIC CONVERTER
- 2 - CLAMP
- 3 - MUFFLER

inal equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

(1) Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.

(2) Position the exhaust pipe to manifold. Install the bolts, retainers and nuts. Tighten the nuts to 31 N·m (23 ft. lbs.) torque.

(3) Tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST PIPE - 5.9L HEAVY DUTY/8.0L

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove exhaust pipe to manifold bolts, retainers and nuts (Fig. 8).
- (4) Remove the clamp nuts (Fig. 9) (Fig. 10).
- (5) Disconnect the exhaust pipe from the support hangers on the 5.9L (Heavy Duty) and the 8.0L engines (Fig. 8).
- (6) Remove the exhaust pipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

(1) Connect the exhaust pipe support hangers on the (Fig. 8).

(2) Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.

(3) Position the exhaust pipe to manifold. Install the bolts, retainers and nuts. Tighten the nuts to 31 N·m (23 ft. lbs.) torque.

(4) Tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST PIPE - 5.9L DIESEL

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise and support the vehicle on a hoist.

(3) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

(4) Remove the exhaust pipe-to-extension pipe clamp. Separate the exhaust pipe and extension pipe.

(5) Remove the exhaust pipe-to-turbocharger elbow bolts (Fig. 11).

(6) Remove the exhaust pipe from the transmission support (Fig. 11).

J9411-18

Fig. 11 Exhaust Pipe Removal/Installation

- 1 - EXHAUST PIPE

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure

EXHAUST PIPE - 5.9L DIESEL (Continued)

proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Install the exhaust pipe into the transmission support and onto the turbocharger flange (Fig. 11).
- (2) Install the exhaust pipe-to-turbocharger elbow bolts and tighten to 31 N·m (23 ft. lbs.) torque.
- (3) Install the extension pipe and clamp to the exhaust pipe using a new clamp and tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Connect the battery negative cables.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required. Adjust the alignment, if needed.

HEAT SHIELDS**DESCRIPTION**

There are two types of heat shields used. One is stamped steel the other is molded foil sheets. The shields attach to the vehicle around the exhaust system to prevent heat from the exhaust system from

entering the passenger area and other areas where the heat can cause damage to other components.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the nuts or bolts holding the exhaust heat shield to the floor pan, crossmember or bracket.
- (3) Slide the shield out around the exhaust system.

INSTALLATION

- (1) Position the exhaust heat shield to the floor pan, crossmember or bracket and install the nuts or bolts.
- (2) Tighten the nuts and bolts 11 N·m (100 in. lbs.).
- (3) Lower the vehicle.

MUFFLER - 3.9L/5.2L/5.9L/8.0L**REMOVAL**

- (1) Raise and support the vehicle.
- (2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Disconnect the muffler hanger (Fig. 12) (Fig. 13).
- (4) Remove clamps and nuts (Fig. 12) (Fig. 13).
- (5) Remove the muffler.

- 2 - TAILPIPE
- 3 - CLAMP
- 4 - MUFFLER
- 5 - INSULATOR

INSTALLATION

- (1) Assemble muffler and clamps loosely to permit proper alignment of all parts.
- (2) Connect the muffler hanger.
- (3) Tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

MUFFLER - 5.9L DIESEL

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise and support the vehicle.
- (3) Remove the muffler to tail pipe and extension pipe clamps (Fig. 14).
- (4) Disconnect the muffler from the hanger isolators (Fig. 14).
- (5) Disconnect the muffler from the tailpipe.
- (6) Disconnect the muffler from the extension pipe and remove from the vehicle..

INSTALLATION

- (1) Install the muffler hanger rods into the isolators (Fig. 14).

**Fig. 14 Muffler Removal/Installation**

- 1 - HANGER BRACKETS
- 2 - ISOLATOR

- 7 - HANGER W/CLAMP

- (2) Install the muffler into the extension pipe.
- (3) Install the muffler into the tail pipe.
- (4) Install the exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 48 N·m (35 ft. lbs.) torque.
- (5) Lower the vehicle.
- (6) Connect the battery negative cables.
- (7) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

TAILPIPE - 3.9L/5.2L/5.9L

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Disconnect the exhaust tailpipe support hanger.
- (4) Remove clamps and nuts.
- (5) Remove the exhaust tailpipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with orig-

TAILPIPE - 3.9L/5.2L/5.9L (Continued)

inal equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Loosely assemble exhaust tailpipe to permit proper alignment of all parts.
- (2) Connect the support hangers.
- (3) Position the exhaust tailpipe for proper clearance with the underbody parts.
- (4) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (5) Lower the vehicle.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Adjust the alignment, if needed.

TAILPIPE - 5.9L HEAVY DUTY/8.0L

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the clamp nuts with Mopar® Rust Penetrant. Allow 5 minutes for penetration.
- (3) Disconnect the exhaust tailpipe support hangers (Fig. 15).
- (4) Remove clamps and nuts.
- (5) Remove the exhaust tailpipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Loosely assemble exhaust tailpipe to permit proper alignment of all parts (Fig. 15).
- (2) Connect the support hangers (Fig. 15).
- (3) Position the exhaust tailpipe for proper clearance with the underbody parts.
- (4) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (5) Lower the vehicle.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Adjust the alignment, if needed.

TAILPIPE - 5.9L DIESEL

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise and support the vehicle.
- (3) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (4) Disconnect the exhaust tailpipe support hanger isolators (Fig. 16).
- (5) Remove the muffler-to-tailpipe clamps (Fig. 16).
- (6) Remove the tailpipe from the vehicle.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Install the tailpipe into the muffler.
- (2) Install the tailpipe hanger rods into the isolators (Fig. 16)
- (3) Install the exhaust clamp, align the exhaust system, and tighten the clamp 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Connect the battery negative cables.

TAILPIPE - 5.9L DIESEL (Continued)

**Fig. 17 Resonator Removal/Installation**

- 1 - EXTENSION PIPE
- 2 - RESONATOR
- 3 - EXTENSION PIPE
- 4 - CLAMP

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

RESONATOR

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Remove the exhaust clamps from the resonator to extension pipes (Fig. 17).
- (4) Separate the resonator from the front and rear extension pipes (Fig. 17) and remove the resonator from the vehicle.

INSTALLATION

- (1) Assemble the resonator to the front and rear extension pipes (Fig. 17).
- (2) Install new exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 48 N·m (35 ft. lbs.) torque.
- (3) Lower the vehicle.
- (4) Connect the battery negative cables.
- (5) Start the engine and inspect for exhaust leaks.

TURBOCHARGER

DESCRIPTION

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (4) major component systems (Fig. 18) (Fig. 19):

- Turbine section
- Compressor section
- Bearing housing
- Wastegate

OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:

- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

80bfe0b6

Fig. 19 Turbocharger Wastegate Actuator

- 1 - TURBOCHARGER
- 2 - DIAPHRAGM
- 3 - WASTE GATE ACTUATOR

The turbocharger also uses a wastegate (Fig. 20), which regulates intake manifold air pressure and

prevents over boosting at high engine speeds. When the wastegate valve is closed, all of the exhaust gases flow through the turbine wheel. As the intake manifold pressure increases, the wastegate actuator opens the valve, diverting some of the exhaust gases away from the turbine wheel. This limits turbine shaft speed and air output from the impeller.

80b5cc53

Fig. 20 Wastegate Operation

- 5 - TURBINE
- 6 - EXHAUST BYPASS VALVE
- 7 - WASTEGATE
- 8 - EXHAUST
- 9 - TURBINE
- 10 - SIGNAL LINE

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line that is tapped into the oil filter head. The oil travels into the bearing housing, where it lubricates the shaft and bearings (Fig. 21). A return pipe at the bottom of the

TURBOCHARGER (Continued)

bearing housing, routes the engine oil back to the crankcase.

80b5cc57

Fig. 21 Turbocharger Oil Supply and Drain

- 1 - BEARINGS
- 2 - OIL SUPPLY (FROM FILTER HEAD)
- 3 - OIL RETURN (TO SUMP)

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate "cool-down" periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Disconnect the exhaust pipe from the turbocharger elbow (Fig. 22).
- (4) Lower vehicle.
- (5) Disconnect the turbocharger air inlet hose (Fig. 23).
- (6) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 24).
- (7) Disconnect the charge air cooler inlet pipe from the turbocharger (Fig. 24).

J9411-18

- 7 - CLIPS (4)
- 8 - TUBE ALIGNMENT NOTCHES

(8) Remove the turbocharger and gasket from the exhaust manifold.

(9) If the turbocharger is not to be installed immediately, cover the opening to prevent material from entering into the manifold.

(10) If replacing the turbocharger, transfer the discharge elbow and clamp to the new assembly.

(11) Clean and inspect the sealing surface.

TURBOCHARGER (Continued)

Fig. 24 Oil Supply Line and Charge Air Cooler Inlet Duct

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER
- 3 - AIR INLET TUBE
- 4 - COOLER INLET DUCT

CAUTION: The turbocharger is only serviced as an assembly. Do not attempt to repair the turbocharger as turbocharger and/or engine damage can result.

CLEANING

Clean the turbocharger and exhaust manifold mounting surfaces with a suitable scraper.

INSPECTION

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

(1) Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:

- Cracks in the turbine and compressor housing that go completely through.
- Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
- Cracks in the mounting flange that intersect bolt through-holes.
- Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.

(2) Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips. Note: Some impellers may have a factory placed paint mark which, after normal operation, appears to be a crack.

Remove this mark with a suitable solvent to verify that it is not a crack.

(3) Visually inspect the turbocharger compressor housing for an impeller rubbing condition (Fig. 25). Replace the turbocharger if the condition exists.

(4) Measure the turbocharger axial end play:

(a) Install a dial indicator as shown in (Fig. 26). Zero the indicator at one end of travel.

(b) Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.038 mm (0.0015 in.) MIN. and 0.089 mm (0.0035 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

(5) Measure the turbocharger bearing radial clearance:

(a) Insert a narrow blade or wire style feeler gauge between the compressor wheel and the housing (Fig. 27).

(b) Gently push the compressor wheel toward the housing and record the clearance.

(c) With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.

(d) Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.

(e) Allowable radial bearing clearance is 0.326 mm (0.0128 in.) MIN. and 0.496 mm (0.0195 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assy.

Fig. 25 Inspect Compressor Housing for Impeller Rubbing Condition

INSTALLATION

(1) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(2) Install the oil drain tube and oil supply line to the turbocharger (Fig. 24). Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

TURBOCHARGER (Continued)

80b5cc54

Fig. 26 Measure Turbocharger Axial End Play

80b5cc55

Fig. 27 Measure Turbocharger Bearing Radial Clearance

1 - FEELER GAUGE

(3) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Carefully rotate the turbocharger impeller by hand to distribute the oil thoroughly.

(4) Install and tighten the oil supply line fitting nut to 20 N·m (133 in. lbs.) torque.

(5) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 11 N·m (95 in. lbs.) torque.

(6) Position the air inlet hose to the turbocharger (Fig. 23). Tighten the clamp to 11 N·m (95 in. lbs.) torque.

(7) Raise vehicle on hoist.

(8) Connect the exhaust pipe to the turbocharger (Fig. 22) and tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(9) Lower the vehicle.

(10) Connect the battery negative cables.

(11) Start the engine to check for leaks.

CHARGE AIR COOLER AND PLUMBING

DESCRIPTION

The charge air system (Fig. 28) consists of the charge air cooler piping, charge air cooler and intake air grid heater.

The charge air cooler is a heat exchanger that uses air flow from vehicle motion to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases engine efficiency and power.

80b5cc52

Fig. 28 Intake Air Circulation

1 - CHARGE AIR COOLER

2 - AIRFILTER

3 - TURBOCHARGER

OPERATION

Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in front of the radiator. From the charge air cooler the air flows back into the intake manifold.

REMOVAL

WARNING: IF THE ENGINE WAS JUST TURNED OFF, THE AIR INTAKE SYSTEM TUBES MAY BE HOT.

(1) Disconnect the battery negative cables.

(2) Remove the front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front BUMPER - REMOVAL).

CHARGE AIR COOLER AND PLUMBING (Continued)

(3) Remove the front support bracket.

(4) Discharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) and remove the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL) (Fig. 29) (if A/C equipped) .

(5) Remove the transmission auxiliary cooler (Fig. 29) (Refer to 7 - COOLING/TRANSMISSION/TRANSCOOER - REMOVAL).

Fig. 29 Condenser and Transmission Auxiliary Cooler

- 1 - A/C CONDENSOR
- 2 - TRANSMISSION COOLER
- 3 - INTERCOOLER

(6) Remove the boost tubes from the charge air cooler (Fig. 30).

(7) Remove the charge air cooler bolts. Pivot the charge air cooler forward and up to remove.

CLEANING

CAUTION: Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

NOTE: If internal debris cannot be removed from the cooler, the charge air cooler **MUST** be replaced.

(1) If the engine experiences a turbocharger failure or any other situation where oil or debris get into the charge air cooler, the charge air cooler must be cleaned internally.

(2) Position the charge air cooler so the inlet and outlet tubes are vertical.

(3) Flush the cooler internally with solvent in the direction opposite of normal air flow.

Fig. 30 Air Intake System Tubes

- 1 - CLAMP
- 2 - INTERCOOLER INLET DUCT
- 3 - CLAMP
- 4 - VALVE COVER
- 5 - AIR INLET HOUSING
- 6 - CLAMP
- 7 - INTERCOOLER OUTLET DUCT
- 8 - CLAMP
- 9 - INTERCOOLER

(4) Shake the cooler and lightly tap on the end tanks with a rubber mallet to dislodge trapped debris.

(5) Continue flushing until all debris or oil are removed.

(6) Rinse the cooler with hot soapy water to remove any remaining solvent.

(7) Rinse thoroughly with clean water and blow dry with compressed air.

INSPECTION

Visually inspect the charge air cooler for cracks, holes, or damage. Inspect the tubes, fins, and welds for tears, breaks, or other damage. Replace the charge air cooler if damage is found.

Pressure test the charge air cooler, using Charge Air Cooler Tester Kit #3824556. This kit is available through Cummins® Service Products. Instructions are provided with the kit.

INSTALLATION

(1) Position the charge air cooler. Install the bolts and tighten to 2 N·m (17 in. lbs.) torque.

CHARGE AIR COOLER AND PLUMBING (Continued)

(2) Install the air intake system tubes to the charge air cooler . With the clamps in position, tighten the clamps to 11 N·m (95 in. lbs.) torque.

(3) Install the transmission auxiliary cooler (if equipped) (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(4) Install the A/C condenser (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION). Recharge A/C system (Refer to 24 - HEATING & AIR

CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(5) Install the front support bracket. Install and tighten the bolts.

(6) Install the front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).

(7) Connect the battery negative cables.

(8) Start engine and check for boost system leaks.

BUMPERS

DESCRIPTION

Bumpers are used at the front and rear of the vehicle. Bumpers may be chrome or painted.

Bumpers are designed to protect the exterior sheet-metal in low impact situations. The bumpers are attached to the frame and provide mounting points for some optional accessories such as fog lights and tow hooks.

FRONT AIR DAM

REMOVAL

- (1) Remove Pin-type fasteners attaching air dam to bottom of front bumper (Fig. 1).
- (2) Remove screws attaching air dam to bottom of front bumper.
- (3) Separate air dam from bumper.

FRONT AIR DAM (Continued)

**Fig. 1 Front Bumper Air Dam**

- 1 - BUMPER
- 2 - SCREW
- 3 - LOWER AIR DAM
- 4 - PIN TYPE FASTENER
- 5 - LOWER FASCIA

INSTALLATION

- (1) Position air dam on bumper.
- (2) Install screws attaching air dam to bottom of front bumper.
- (3) Install Pin-type fasteners attaching air dam to bottom of front bumper.

FRONT FASCIA**REMOVAL**

- (1) Open hood.
- (2) Remove fasteners at fender side openings.
- (3) Separate fascia from bumper.

INSTALLATION

- (1) Position fascia on bumper.
- (2) Install front fascia. See fascia adjustment procedure in this section.
- (3) Install fasteners at fender side openings.

ADJUSTMENT

- (1) Remove the plastic rivet that secures the front upper fascia to the front lower fascia (Fig. 2).
- (2) Position the upper front fascia so that there is approximately a 19 mm (3/4 in.) gap between the

lower portion of the front fender and the upper portion of the front upper fascia (Fig. 3). The gap should ideally be 19 mm (3/4 in.), but it is more important to avoid a V-Gap between the lower portion of the front fender and the upper portion of the front upper fascia than maintaining the gap. There are ribs in the front upper fascia and lower fascia that will hold the front upper fascia in position (Fig. 4).

- (3) Attach the front upper fascia to the front lower fascia using a new plastic rivet.

80bcea80

Fig. 2 Fascia Rivet

FRONT LOWER FASCIA

REMOVAL

- (1) Open hood.
- (2) Remove fasteners at side fender openings.
- (3) Remove lower air dam. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT AIR DAM - REMOVAL)
- (4) Disengage clips attaching end of upper fascia to bumper face bar (Fig. 5).
- (5) Disengage clips attaching lower fascia to bumper face bar.
- (6) Separate lower fascia from bumper.

INSTALLATION

- (1) Position lower fascia on bumper.
- (2) Engage clips attaching lower fascia to bumper face bar.
- (3) Install lower air dam. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT AIR DAM - INSTALLATION)
- (4) Install fasteners at side fender openings.

FRONT FASCIA—SPORT

REMOVAL

The fascia can be removed from the vehicle without removing the bumper.

- (1) Disconnect wire connectors from fog lamps.
- (2) Remove screws attaching rearward edges of fascia to outer bumper brackets (Fig. 7).
- (3) Remove screws attaching bottom of air deflector.

**Fig. 5 Front Bumper Lower Fascia**

- 1 - LOWER FASCIA
- 2 - RETAINING CLIP
- 3 - BUMPER

J9413-2

- (4) Lift top of fascia upward to disengage from retaining clips on front bumper.
- (5) Pull fascia from front bumper and separate from vehicle.

INSTALLATION

- (1) Position fascia on front bumper.
- (2) Engage fascia with retaining clips on front bumper.
- (3) Install screws attaching bottom of fascia to air deflector.
- (4) Align fascia and wheelhouse liners with outer bumper brackets and install screws.
- (5) Connect harness connectors to fog lamps.

FRONT BUMPER

REMOVAL

- (1) Support front bumper on a suitable lifting device.
- (2) Remove bolts attaching front bumper outer bracket to frame rail (Fig. 6).
- (3) Remove nuts and stud plates attaching front bumper to end of frame rail.
- (4) Disengage wire connectors from fog lamps, if equipped.
- (5) Separate front bumper from vehicle.

INSTALLATION

- (1) Support front bumper on a suitable lifting device.
- (2) Position front bumper on vehicle.
- (3) Engage fog lamp wire connectors, if equipped.
- (4) Install nuts and stud plates attaching front bumper to end of frame rail. Tighten nuts to 94 N·m (70 ft. lbs.) torque.
- (5) Install bolts attaching front bumper outer bracket to frame rail. Tighten bolts to 94 N·m (70 ft. lbs.) torque.

FRONT BUMPER—SPORT**REMOVAL**

- (1) Disconnect wire connectors from fog lamps.
- (2) Remove screws attaching fascia and outer bumper brackets to wheelhouse liners.

- (3) Remove screws and push-in fasteners attaching bottom of fascia to air deflector.
- (4) Support bumper on a suitable lifting device.
- (5) Remove nuts attaching bumper to inner bumper brackets (Fig. 7).
- (6) Separate bumper from vehicle.

INSTALLATION

- (1) Support bumper on a suitable lifting device.
- (2) Position bumper on vehicle.
- (3) Install nuts attaching bumper to inner bumper brackets. Tighten nuts to 94 N·m (70 ft. lbs.) torque.
- (4) Install screws and push-in fasteners attaching bottom of fascia to air deflector.
- (5) Align fascia and wheelhouse liners with outer bumper brackets and install screws. See fascia adjustment in this section.
- (6) Connect wire connectors to fog lamps.

FRAME

DESCRIPTION

The BR/BE frame is the structural center of the vehicle. In addition to supporting the body and payload, the frame provides a station for the engine and drivetrain. BR/BE trucks have a ladder type frame with Box-section front rails, dropped center section, and open-channel side rails in the rear.

Cross members attach to the side rails with rivets, welds, or bolts. The cab is isolated from the frame with rubber load cushions with through bolts. The cargo box or bed is attached to the frame with bolts.

The frame is designed to absorb and dissipate flexing and twisting due to acceleration, braking, cornering, and road surface variances without bending when subjected to normal driving conditions.

FRAME SERVICE

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE EYE PROTECTION WHEN GRINDING OR WELDING METAL, SERIOUS EYE INJURY CAN RESULT. BEFORE PROCEEDING WITH FRAME REPAIR INVOLVING GRINDING OR WELDING, VERIFY THAT VEHICLE FUEL SYSTEM IS NOT LEAKING OR IN CONTACT WITH REPAIR AREA, PERSONAL INJURY CAN RESULT. DO NOT ALLOW OPEN FLAME TO CONTACT PLASTIC BODY PANELS. FIRE OR EXPLOSION CAN RESULT. WHEN WELDED FRAME COMPONENTS ARE REPLACED, 100% PENETRATION WELD MUST BE ACHIEVED DURING INSTALLATION. IF NOT, DANGEROUS OPERATING CONDITIONS CAN RESULT. STAND CLEAR OF CABLES OR CHAINS ON PULLING EQUIPMENT DURING FRAME STRAIGHTENING OPERATIONS, PERSONAL INJURY CAN RESULT. DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT SUPPORTED ON SAFETY STANDS, PERSONAL INJURY CAN RESULT.

FRAME (Continued)

CAUTION: Do not reuse damaged fasteners, quality of repair would be suspect. Do not drill holes in top or bottom frame rail flanges, frame rail failure can result. Do Not use softer than Grade 5 bolts to replace production fasteners, loosening or failure can result. When using heat to straighten frame components do not exceed 566°C (1050°F), metal fatigue can result. Welding the joints around riveted cross members and frame side rails can weaken frame.

FRAME STRAIGHTENING

When necessary, a conventional frame that is bent or twisted can be straightened by application of heat. The temperature must not exceed 566°C (1050°F). The metal will have a dull red glow at the desired temperature. Excessive heat will decrease the strength of the metal and result in a weakened frame.

Welding the joints around riveted cross members and frame side rails is not recommended.

A straightening repair process should be limited to frame members that are not severely damaged. The replacement bolts, nuts and rivets that are used to join the frame members should conform to the same specifications as the original bolts, nuts and rivets.

FRAME REPAIRS

DRILLING HOLES

Do not drill holes in frame side rail top and bottom flanges, metal fatigue can result causing frame failure. Holes drilled in the side of the frame rail must be at least 38 mm (1.5 in.) from the top and bottom flanges.

Additional drill holes should be located away from existing holes.

WELDING

Use MIG, TIG or arc welding equipment to repair welded frame components.

Frame components that have been damaged should be inspected for cracks before returning the vehicle to use. If cracks are found in accessible frame components perform the following procedures.

(1) Drill a hole at each end of the crack with a 3 mm (0.125 in.) diameter drill bit.

(2) Using a suitable die grinder with 3 inch cut off wheel, V-groove the crack to allow 100% weld penetration.

(3) Weld the crack.

(4) If necessary when a side rail is repaired, grind the weld smooth and install a reinforcement channel (Fig. 9) over the repaired area.

NOTE: If a reinforcement channel is required, the top and bottom flanges should be 0.250 inches narrower than the side rail flanges. Weld only in the areas indicated (Fig. 9).

Fig. 9 Frame Reinforcement

- 1 - .250 IN FROM EDGE
- 2 - TOP FLANGE
- 3 - BOTTOM FLANGE
- 4 - FRAME RAIL
- 5 - FRAME REPAIR REINFORCEMENT

FRAME FASTENERS

Bolts, nuts and rivets can be used to repair frames or to install a reinforcement section on the frame. Bolts can be used in place of rivets. When replacing rivets with bolts, install the next larger size diameter bolt to assure proper fit. If necessary, ream the hole out just enough to sufficiently receive the bolt.

Conical-type washers are preferred over the splitting type lock washers. Normally, grade-5 bolts are adequate for frame repair. **Grade-3 bolts or softer should not be used.** Tightening bolts/nuts with the correct torque, refer to the Introduction Group at the front of this manual for tightening information.

SPECIFICATIONS

FRAME DIMENSION

Frame dimensions are listed in Millimeters (mm) scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location (Fig. 10).

FRONT TOW HOOK (Continued)

Installation

Some vehicles are equipped with front tow hooks. The tow hooks are to be used for **EMERGENCY** purposes only.

- (1) Position the tow hooks on the frame.
- (2) Install the fasteners that attach the tow hooks to the frame.
- (3) Tighten the nuts to 108 N·m (80 ft. lbs.) torque.

SPARE TIRE WINCH**REMOVAL**

- (1) Remove spare tire from under vehicle.
- (2) Remove cotter pin attaching winch tube to spare tire winch.
- (3) Pull winch tube from spare tire winch.
- (4) Remove bolts attaching spare tire winch to crossmember (Fig. 13).
- (5) Separate spare tire winch from vehicle.

INSTALLATION

- (1) Position spare tire winch on vehicle.
- (2) Install bolts holding spare tire winch to spare crossmember.
- (3) Insert winch tube into spare tire winch.
- (4) Install cotter pin attaching winch tube to spare tire winch.
- (5) Install spare tire.

FUEL PUMP CAPACITY TEST	9		

FUEL DELIVERY - GASOLINE

DESCRIPTION - FUEL DELIVERY SYSTEM

The fuel delivery system consists of:

- the fuel pump module containing the electric fuel pump, fuel filter/fuel pressure regulator, rollover valve (certain modules), fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of pump module
- fuel tubes/lines/hoses
- quick-connect fittings
- fuel injector rail
- fuel injectors
- fuel tank
- fuel tank filler/vent tube assembly
- fuel tank filler tube cap
- accelerator pedal
- throttle cable

OPERATION - FUEL DELIVERY SYSTEM

Fuel is returned through the fuel pump module and back into the fuel tank through the fuel filter/fuel pressure regulator. A separate fuel return line from the engine to the tank is not used with any gasoline powered engine.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module lock-nut/gasket and rollover valve(s) (refer to 25, Emission Control System for rollover valve information).

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used. The fuel filler tube contains a flap door located below the fuel fill cap.

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in 25, Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

DIAGNOSIS AND TESTING - FUEL PRESSURE LEAK DOWN TEST

Use this test in conjunction with the Fuel Pump Pressure Test and Fuel Pump Capacity Test.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After

the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

Abnormally long periods of cranking to restart a **hot** engine that has been shut down for a short period of time may be caused by:

- Fuel pressure bleeding past a fuel injector(s).
- Fuel pressure bleeding past the check valve in the fuel pump module.

(1) Disconnect the fuel inlet line at fuel rail. Refer to Fuel Tubes/Lines/Hoses and Clamps for procedures. On some engines, air cleaner housing removal may be necessary before fuel line disconnection.

(2) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.

(3) Connect correct Fuel Line Pressure Test Adapter Tool Hose between disconnected fuel line and fuel rail (Fig. 1).

80ae8311

Fig. 1 Connecting Adapter Tool—Typical

- 4 - FUEL PRESSURE TEST GAUGE
- 5 - FUEL LINE CONNECTION AT RAIL
- 6 - FUEL RAIL

FUEL DELIVERY - GASOLINE (Continued)

(4) Connect the 0-414 kPa (0-60 psi) fuel pressure test gauge (from Gauge Set 5069) to the test port on the appropriate Adaptor Tool. **The DRB® III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

The fittings on both tools must be in good condition and free from any small leaks before performing the proceeding test.

(5) Start engine and bring to normal operating temperature.

(6) Observe test gauge. Normal operating pressure should be 339 kPa +/-34 kPa (49.2 psi +/-5 psi).

(7) Shut engine off.

(8) Pressure should not fall below **30 psi for five minutes.**

(9) If pressure falls below 30 psi, it must be determined if a fuel injector, the check valve within the fuel pump module, or a fuel tube/line is leaking.

(10) Again, start engine and bring to normal operating temperature.

(11) Shut engine off.

(12) **Testing for fuel injector or fuel rail leakage:** Clamp off the rubber hose portion of Adaptor Tool between the fuel rail and the test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a fuel injector or the fuel rail is leaking.

(13) **Testing for fuel pump check valve, filter/regulator check valve or fuel tube/line leakage:** Clamp off the rubber hose portion of Adaptor Tool between the vehicle fuel line and test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a leak may be found at a fuel tube/line. If no leaks are found at fuel tubes or lines, one of the check valves in either the electric fuel pump or filter/regulator may be leaking.

Note: A quick loss of pressure usually indicates a defective check valve in the filter/regulator. A slow loss of pressure usually indicates a defective check valve in the electric fuel pump.

The electric fuel pump is not serviced separately. Replace the fuel pump module assembly. The filter/regulator may be replaced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE

Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.

(1) Remove fuel fill cap.

(2) Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(3) Start and run engine until it stalls.

(4) Attempt restarting engine until it will no longer run.

(5) Turn ignition key to OFF position.

CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.

(6) Unplug connector from any fuel injector.

(7) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.

(8) Connect other end of jumper wire to positive side of battery.

(9) Connect one end of a second jumper wire to remaining injector terminal.

CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.

(10) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.

(11) Place a rag or towel below fuel line quick-connect fitting at fuel rail.

(12) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.

(13) Return fuel pump relay to PDC.

(14) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB® scan tool must be used to erase a DTC.

FUEL FILTER/PRESSURE REGULATOR

DESCRIPTION

A combination fuel filter and fuel pressure regulator (Fig. 2) is used on all engines. It is located on the top of the fuel pump module. A separate frame mounted fuel filter is not used with any engine.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

OPERATION

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is not controlled by engine vacuum or the powertrain control module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi) at the fuel injectors. It contains a diaphragm, calibrated springs and a fuel

80a92a65

Fig. 2 Side View—Filter/Regulator

- 1 - INTERNAL FUEL FILTER
- 2 - FUEL FLOW TO FUEL INJECTORS
- 3 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 4 - EXCESS FUEL BACK TO TANK
- 5 - FUEL INLET
- 6 - RUBBER GROMMET
- 7 - TOP OF PUMP MODULE

return valve. The internal fuel filter (Fig. 2) is also part of the assembly.

Fuel is supplied to the filter/regulator by the electric fuel pump through an opening tube at the bottom of filter/regulator (Fig. 2).

The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet end of the electric fuel pump. **Refer to Fuel Pump—Description and Operation for more information. Also refer to the Fuel Pressure Leak Down Test and the Fuel Pump Pressure Tests.**

If fuel pressure at the pressure regulator exceeds approximately 49.2 psi, an internal diaphragm opens and excess fuel pressure is routed back into the tank through the bottom of pressure regulator.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE, EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL FILTER/FUEL PRESSURE REGULATOR, FUEL SYSTEM PRESSURE MUST BE RELEASED.

FUEL FILTER/PRESSURE REGULATOR (Continued)

Refer to Fuel System Pressure Release in Fuel Delivery System section of this group.

The fuel filter/fuel pressure regulator (Fig. 3) is located at top of fuel pump module (Fig. 4) or (Fig. 5).

Fuel pump module removal is not necessary.

(1) Drain fuel tank and remove tank. Refer to Fuel Tank Removal/Installation.

(2) The fuel filter/regulator is pressed into a rubber grommet. Remove by twisting and pulling straight up (Fig. 6).

CAUTION: Do not pull filter/regulator more than three inches from fuel pump module. Damage to coiled fuel tube (line) may result.

(3) Gently cut old fuel tube (line) clamp (Fig. 7) taking care not to damage plastic fuel tube. Remove and discard old fuel tube clamp.

(4) Remove plastic fuel tube from filter/regulator by gently pulling downward. Remove filter/regulator from fuel pump module.

INSTALLATION

(1) Install a new clamp over plastic fuel tube.

(2) Install filter/regulator to fuel tube. Rotate filter/regulator in fuel tube (line) (Fig. 8) until it is pointed to drivers side of vehicle (Fig. 4) or (Fig. 5).

(3) Tighten line clamp to fuel line using special Hose Clamp Pliers number C-4124 or equivalent (Fig. 8). **Do not use conventional side cutters to tighten this type of clamp.**

(4) Press filter/regulator (by hand) into rubber grommet. The assembly should be pointed towards drivers side of vehicle (Fig. 4) or (Fig. 5).

(5) Install fuel tank. Refer to Fuel Tank Removal/Installation.

(6) Check for fuel leaks.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

For Fuel Gauge Operation: A constant current source of about 32 mA is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). The resistor track is used to vary the voltage depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit. Output voltages will vary from about .6 volts at FULL, to about 8.6 volts at EMPTY (Jeep models), or, about 7.0 volts at EMPTY (Dodge Truck models). **NOTE: For diagnostic purposes, this voltage can only be verified with the fuel gauge sending unit circuit closed (i.e. having all of the sending units electrical connectors connected).**

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

For OBD II Emission Monitor Requirements: The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

DIAGNOSIS AND TESTING - FUEL GAUGE SENDING UNIT

The fuel gauge sending unit contains a variable resistor (track). As the float moves up or down, electrical resistance will change. Refer to 8, Instrument Panel and Gauges for Fuel Gauge testing. To test the gauge sending unit only, it must be removed from vehicle. The unit is part of the fuel pump module. Refer to Fuel Pump Module Removal/Installation for procedures. Measure the resistance across the sending unit terminals. With float in up position, resistance should be 20 ohms \pm 6 ohms. With float in down position, resistance should be 220 ohms \pm 6 ohms.

REMOVAL

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 9). The fuel pump module is located inside of fuel tank.

(1) Remove fuel tank. Refer to Fuel Tank—All Engines in the Removal/Installation section.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Unplug 4-way electrical connector (Fig. 9).

(4) Disconnect 2 sending unit wires at 4-way connector. The locking collar of connector must be removed before wires can be released from connector. Note location of wires within 4-way connector.

(5) The sending unit is retained to pump module with a small lock tab and notch (Fig. 10). Carefully push lock tab to the side and away from notch while sliding sending unit downward on tracks for removal. Note wire routing while removing unit from module.

- 4 - TRACKS

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

INSTALLATION

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 9). The fuel pump module is located inside of fuel tank.

- (1) Position sending unit into tracks. Note wire routing.
- (2) Push unit on tracks until lock tab snaps into notch.
- (3) Connect 2 sending unit wires into 4-way connector and install locking collar.
- (4) Connect 4-way electrical connector to module.
- (5) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.
- (6) Install fuel tank. Refer to Fuel Tank-All Engines in the Removal/Installation section.

FUEL LINES

DESCRIPTION

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

FUEL PUMP

DESCRIPTION

The fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump.

OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** Refer to the Fuel Pressure Leak Down Test for more information.

DIAGNOSIS AND TESTING - FUEL PUMP CAPACITY TEST

Before performing this test, verify fuel pump pressure. Refer to Fuel Pump Pressure Test. Use this test in conjunction with the Fuel Pressure Leak Down Test.

- (1) Release fuel system pressure. Refer to Fuel Pressure Release Procedure.
- (2) Disconnect fuel supply line at fuel rail. Refer to Quick-Connect Fittings. Some engines may require air cleaner housing removal before line disconnection.
- (3) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.
- (4) Connect correct Fuel Line Pressure Test Adapter Tool Hose into disconnected fuel supply line. Insert other end of Adaptor Tool Hose into a graduated container.
- (5) Remove fuel fill cap.
- (6) To activate fuel pump and pressurize system, obtain DRB® scan tool and actuate ASD Fuel System Test.
- (7) A good fuel pump will deliver at least 1/4 liter of fuel in 7 seconds. Do not operate fuel pump for longer than 7 seconds with fuel line disconnected as fuel pump module reservoir may run empty.
 - (a) If capacity is lower than specification, but fuel pump can be heard operating through fuel fill cap opening, check for a kinked/damaged fuel supply line somewhere between fuel rail and fuel pump module.
 - (b) If line is not kinked/damaged, and fuel pressure is OK, but capacity is low, replace fuel filter/fuel pressure regulator. The filter/regulator may be serviced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.
 - (c) If both fuel pressure and capacity are low, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

FUEL PUMP (Continued)

DIAGNOSIS AND TESTING - FUEL PUMP
PRESSURE TEST

Use this test in conjunction with the Fuel Pump Capacity Test, Fuel Pressure Leak Down Test and Fuel Pump Amperage Test found elsewhere in this group.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

All fuel systems are equipped with a fuel tank module mounted, combination fuel filter/fuel pressure regulator. The fuel pressure regulator is not controlled by engine vacuum.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. BEFORE DISCONNECTING FUEL LINE AT FUEL RAIL, THIS PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

(1) Remove protective cap at fuel rail test port. Connect the 0–414 kPa (0–60 psi) fuel pressure gauge (from gauge set 5069) to test port pressure fitting on fuel rail (Fig. 11). **The DRB® III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

(2) Start and warm engine and note pressure gauge reading. Fuel pressure should be 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi) at idle.

(3) If engine runs, but pressure is below 44.2 psi, check for a kinked fuel supply line somewhere between fuel rail and fuel pump module. If line is not kinked, but specifications for either the Fuel Pump Capacity, Fuel Pump Amperage or Fuel Pressure Leak Down Tests were not met, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

(4) If operating pressure is above 54.2 psi, electric fuel pump is OK, but fuel pressure regulator is defective. Replace fuel filter/fuel pressure regulator. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for more information.

(5) Install protective cap to fuel rail test port.

- 3 - FUEL RAIL

DIAGNOSIS AND TESTING - FUEL PUMP
AMPERAGE TEST

This amperage (current draw) test is to be done in conjunction with the Fuel Pump Pressure Test, Fuel Pump Capacity Test and Fuel Pressure Leak Down Test. Before performing the amperage test, be sure the temperature of the fuel tank is above 50° F (10° C).

The DRB® Scan Tool along with the DRB Low Current Shunt (LCS) adapter (Fig. 12) and its test leads will be used to check fuel pump amperage specifications.

80add391

Fig. 12 Low Current Shunt

- 1 - LOW CURRENT SHUNT ADAPTER
- 2 - PLUG TO DRB
- 3 - TEST LEAD RECEPTACLES

FUEL PUMP (Continued)

(1) Be sure fuel tank contains fuel before starting test. If tank is empty or near empty, amperage readings will be incorrect.

(2) Obtain LCS adapter.

(3) Plug cable from LCS adapter into DRB scan tool at SET 1 receptacle.

(4) Plug DRB into vehicle 16-way connector (data link connector).

(5) Connect (-) and (+) test cable leads into LCS adapter receptacles. Use **10 amp (10A +)** receptacle and common (-) receptacles.

(6) Gain access to MAIN MENU on DRB screen.

(7) Press DVOM button on DRB.

(8) Using left/right arrow keys, highlight CHANNEL 1 function on DRB screen.

(9) Press ENTER three times.

(10) Using up/down arrow keys, highlight RANGE on DRB screen (screen will default to 2 amp scale).

(11) Press ENTER to change 2 amp scale to 10 amp scale. **This step must be done to prevent damage to DRB scan tool or LCS adapter (blown fuse).**

(12) Remove cover from Power Distribution Center (PDC).

(13) Remove fuel pump relay from PDC. Refer to label on PDC cover for relay location.

WARNING: BEFORE PROCEEDING TO NEXT STEP, NOTE THE FUEL PUMP WILL BE ACTIVATED AND SYSTEM PRESSURE WILL BE PRESENT. THIS WILL OCCUR AFTER CONNECTING TEST LEADS FROM LCS ADAPTER INTO FUEL PUMP RELAY CAVITIES. THE FUEL PUMP WILL OPERATE EVEN WITH IGNITION KEY IN OFF POSITION. BEFORE ATTACHING TEST LEADS, BE SURE ALL FUEL LINES AND FUEL SYSTEM COMPONENTS ARE CONNECTED.

CAUTION: To prevent possible damage to the vehicle electrical system and LCS adapter, the test leads must be connected into relay cavities exactly as shown in following steps.

Depending upon vehicle model, year or engine configuration, three different types of relays may be used: Type-1, type-2 and type-3.

(14) If equipped with **type-1 relay** (Fig. 13), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 13).

(15) If equipped with **type-2 relay** (Fig. 14), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 14).

(16) If equipped with **type-3 relay** (Fig. 15), attach test leads from LCS adapter into PDC relay cavities number 3 and 5. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 15).

(17) When LCS adapter test leads are attached into relay cavities, fuel pump **will be activated**. Determine fuel pump amperage on DRB screen. Amperage should be below 10.0 amps. If amperage is below 10.0 amps, and specifications for the Fuel Pump Pressure, Fuel Pump Capacity and Fuel Pressure Leak Down tests were met, the fuel pump module is OK.

(18) If amperage is more than 10.0 amps, replace fuel pump module assembly. The electric fuel pump is not serviced separately.

(19) Disconnect test leads from relay cavities immediately after testing.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module on all gas powered engines is installed in the top of the fuel tank (Fig. 16) or (Fig. 17). The fuel pump module (Fig. 16), (Fig. 17) or (Fig. 18) contains the following:

- A combination fuel filter/fuel pressure regulator
- Electric fuel pump
- Fuel pump reservoir
- A separate in-tank fuel filter (at bottom of module)

- Rollover valve (certain modules)
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection at filter/regulator
- A threaded locknut retaining pump module to fuel tank
- A gasket between tank flange and module
- Auxiliary non-pressurized fuel supply fitting (not all engines)

The fuel gauge sending unit (fuel level sensor), and pick-up filter (at bottom of module) may be serviced separately. If the electrical fuel pump requires service, the entire fuel pump module must be replaced. The fuel filter/fuel pressure regulator may be serviced separately. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

OPERATION

Refer to Fuel Pump, Fuel Filter/Fuel Pressure Regulator and Fuel Gauge Sending Unit.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING THE FUEL PUMP MODULE, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Drain and remove fuel tank. Refer to Fuel Tank - All Engines in the Removal/Installation section.

(2) The plastic fuel pump module locknut is threaded onto fuel tank (Fig. 19) or (Fig. 20). Install Special Tool 6856 to locknut and remove locknut (Fig. 21). The fuel pump module will spring up when locknut is removed.

(3) Remove module from fuel tank.

(2) Position locknut over top of fuel pump module. Install locknut finger tight.

(3) Rotate module until positioned as shown in (Fig. 22) or (Fig. 23). This step must be performed to prevent float from contacting side of fuel tank. Be sure fuel filter/fuel pressure regulator is pointed to drivers side of vehicle.

(4) Install Special Tool 6856 (Fig. 24) to locknut.

(5) Tighten locknut to 24– 44 N·m (18–32 ft. lbs.) torque.

(6) Install fuel tank. Refer to Fuel Tank - All Engines in the Removal/Installation section.

FUEL RAIL

DESCRIPTION - 3.9L/5.2L/5.9L

The fuel injector rail is used to attach the fuel injectors to the engine. It is mounted to the engine (Fig. 25).

80a6f165

Fig. 25 Fuel Rail—3.9/5.2/5.9L Engine—Typical

- 1 - FUEL RAIL CONNECTING HOSE
2 - FUEL RAIL
3 - MOUNTING BOLTS (4)

DESCRIPTION - 8.0L

The fuel injector rail is used to attach the fuel injectors to the engine. The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the lower half of the two-piece intake

manifold (Fig. 26). The metal, one-piece fuel rail is not repairable.

80570e20

Fig. 26 Fuel Rail—8.0L Engine

- 1 - FUEL RAIL
2 - ELECTRICAL CONNECTOR
3 - MOUNTING BOLTS (6)
4 - INTAKE MANIFOLD LOWER HALF
5 - FUEL PRESSURE TEST PORT
6 - FUEL INJECTORS (10)

OPERATION - 3.9L/5.2L/5.9L

High pressure from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

A fuel pressure test port is located on the fuel rail. A quick-connect fitting with a safety latch clip is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

CAUTION: The left and right sections of the fuel rail are connected with a flexible connecting hose. Do not attempt to separate the rail halves at this connecting hose. Due to the design of this connecting hose, it does not use any clamps. Never attempt to install a clamping device of any kind to the hose. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose.

OPERATION - 8.0L

High pressure from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

FUEL RAIL (Continued)

A fuel pressure test port is located on the fuel rail. A quick-connect fitting with a safety latch clip is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

REMOVAL - 3.9L/5.2L/5.9L

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE TURNED OFF). BEFORE SERVICING FUEL RAIL ASSEMBLY, FUEL SYSTEM PRESSURE MUST BE RELEASED.

To release fuel pressure, refer to Fuel System Pressure Release Procedure found in this group.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connecting hose (Fig. 27). Due to the design of this connecting hose, it does use any clamps. Never attempt to install a clamping device of any kind to the hose. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose.

Fig. 27 Fuel Rail Assembly—Typical

- 1 - FUEL RAIL CONNECTING HOSE
- 2 - FUEL RAIL
- 3 - MOUNTING BOLTS (4)

- (1) Remove negative battery cable at battery.
- (2) Remove air cleaner.
- (3) Perform fuel pressure release procedure.
- (4) Remove throttle body from intake manifold. Refer to Throttle Body removal in this group.

(5) If equipped with air conditioning, remove the A-shaped A/C compressor-to-intake manifold support bracket (three bolts) (Fig. 28).

Fig. 28 A/C Compressor Support Bracket—Typical

- 1 - AIR CONDITIONING COMPRESSOR SUPPORT BRACKET
- 2 - MOUNTING BOLTS

(6) Disconnect electrical connectors at all fuel injectors. To remove connector refer to (Fig. 29). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

Fig. 29 Remove/Install Fuel Injector Connector

FUEL RAIL (Continued)

(7) 3.9L (V-6) engine only: Disconnect electrical connector at intake manifold air temperature sensor. Do not remove sensor.

(8) Disconnect fuel tube (line) at side of fuel rail. Refer to Quick-Connect Fittings for procedures.

(9) Remove the remaining fuel rail mounting bolts.

(10) Gently rock and pull the **left** fuel rail until the fuel injectors just start to clear the intake manifold. Gently rock and pull the **right** fuel rail until the fuel injectors just start to clear the intake manifold. Repeat this procedure (left/right) until all fuel injectors have cleared the intake manifold.

(11) Remove fuel rail (with injectors attached) from engine.

(12) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 30) or (Fig. 31).

Fig. 30 Fuel Injector Mounting—Typical

- 1 - CLIP
- 2 - INJECTOR
- 3 - FUEL RAIL

REMOVAL - 8.0L

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Remove negative battery cable at battery.
 (2) Remove air cleaner housing and tube.
 (3) Perform fuel pressure release procedure. Refer to Fuel Delivery System section of this group.

(4) Disconnect throttle body linkage and remove throttle body from intake manifold. Refer to Throttle Body removal in this group.

(5) Remove ignition coil pack and bracket assembly (Fig. 32) at intake manifold and right engine valve cover (four bolts).

(6) Remove upper half of intake manifold. Refer to Engines for procedures.

FUEL RAIL (Continued)

(7) Disconnect electrical connectors at all fuel injectors. To remove connector refer to (Fig. 33). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification.

(8) Disconnect fuel line quick-connect fitting at left-rear end of fuel rail. A special 3/8 inch fuel line disconnection tool will be necessary.

(9) Remove the six fuel rail mounting bolts from the lower half of intake manifold (Fig. 34).

80b6f033

Fig. 33 Remove/Install Fuel Injector Connector

(10) Gently rock and pull the **left** fuel rail until the fuel injectors just start to clear the intake manifold. Gently rock and pull the **right** fuel rail until the fuel injectors just start to clear the intake manifold. Repeat this procedure (left/right) until all fuel injectors have cleared the intake manifold.

(11) Remove fuel rail (with injectors attached) from engine.

(12) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 30) or (Fig. 31).

INSTALLATION - 3.9L/5.2L/5.9L

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

(3) Position the fuel rail/fuel injector assembly to the injector openings on the intake manifold.

80570e20

Fig. 34 Fuel Rail Mounting Bolts—8.0L V-10 Engine—Typical

- 1 - FUEL RAIL
- 2 - ELECTRICAL CONNECTOR
- 3 - MOUNTING BOLTS (6)
- 4 - INTAKE MANIFOLD LOWER HALF
- 5 - FUEL PRESSURE TEST PORT
- 6 - FUEL INJECTORS (10)

(4) Guide each injector into the intake manifold. Be careful not to tear the injector o-ring.

(5) Push the **right** fuel rail down until fuel injectors have bottomed on injector shoulder. Push the **left** fuel rail down until fuel injectors have bottomed on injector shoulder.

(6) Install fuel rail mounting bolts.

(7) Connect electrical connector to intake manifold air temperature sensor.

(8) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 29). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(9) Install the A/C support bracket (if equipped).

(10) Install throttle body to intake manifold. Refer to Throttle Body installation in this section of the group.

(11) Install fuel tube (line) at side of fuel rail. Refer to Quick-Connect Fittings for procedures.

(12) Install air cleaner.

(13) Connect battery cable to battery.

(14) Start engine and check for leaks.

FUEL RAIL (Continued)

INSTALLATION - 8.0L

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

NOTE: The fuel injector electrical connectors on all 10 injectors should be facing to the right (passenger) side of the vehicle (Fig. 34).

(3) Position the fuel rail/fuel injector assembly to the injector openings on the intake manifold.

(4) Guide each injector into the intake manifold. Be careful not to tear the injector o-ring.

(5) Push the **right** fuel rail down until fuel injectors have bottomed on injector shoulder. Push the **left** fuel rail down until fuel injectors have bottomed on injector shoulder.

(6) Install the six fuel rail mounting bolts into the lower half of intake manifold. Tighten bolts to 15 N·m (136 in. lbs.) torque.

(7) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 33). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector. The injector wiring harness is numerically tagged.

(8) Install upper half of intake manifold. Refer to Engines for procedures.

(9) Connect main fuel line at fuel rail. Refer to Quick-Connect Fittings for procedures.

(10) Install ignition coil pack and bracket assembly at intake manifold and right engine valve cover (four bolts).

(11) Install throttle body to intake manifold. Refer to Throttle Body removal in this group.

(12) Install throttle body linkage to throttle body.

(13) Install air cleaner tube and housing.

(14) Install negative battery cable at battery.

(15) Start engine and check for leaks.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

A rollover valve(s) is mounted into the top of the fuel tank (or pump module). Refer to Emission Control System for rollover valve information.

An evaporation control system is connected to the rollover valve(s) to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to Emission Control System for additional information.

REMOVAL

WARNING: GASOLINE POWERED ENGINES: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. BEFORE SERVICING THE FUEL TANK, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE BEFORE SERVICING THE FUEL TANK.

Two different procedures may be used to drain fuel tank (lowering tank or using DRB scan tool). When equipped with a diesel engine, the DRB scan tool cannot be used (no electric fuel pump).

The quickest draining procedure involves lowering the fuel tank.

Gasoline Powered Engines: As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRB scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure in this group for procedures. Attach end of special test hose tool number 6541, 6539, 6631 or 6923 at fuel rail disconnection (tool number will depend on model and/or engine application). Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty.

If electric fuel pump is not operating, tank must be lowered for fuel draining. Refer to following procedures.

(1) Remove fuel tank filler tube cap.

(2) Perform Fuel System Pressure Release procedure as described in this group.

(3) Gasoline Engines: Disconnect negative battery cable at battery. Diesel Engines: Disconnect both negative battery cables at both batteries.

(4) Raise vehicle on hoist.

(5) Certain models are equipped with a separate grounding wire (strap) connecting the fuel fill tube assembly to the body. Disconnect wire by removing screw.

FUEL TANK (Continued)

(6) Open fuel fill door and remove screws mounting fuel filler tube assembly to body. Do not disconnect rubber fuel fill or vent hoses from tank at this time.

(7) Place a transmission jack under center of fuel tank. Apply a slight amount of pressure to fuel tank with transmission jack.

(8) Remove fuel tank mounting strap nuts from mounting strap studs (Fig. 35). If equipped, remove fuel tank shield bolts.

(9) Lower fuel tank only enough to allow access to top of tank. The 2 tank fittings (where rubber fuel fill and vent hose connections are made) must be positioned above tank level. Rotate tank slightly to allow these fittings to be above tank level.

WARNING: WRAP SHOP TOWELS AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(10) While working over left rear tire/wheel, disconnect rubber fuel vent hose at fuel tank (Fig. 35) (vent hose is the smallest of 2 hoses). Position fuel siphoning/drain hose into this fitting at tank. Drain fuel into an approved portable holding tank or a properly labeled gasoline (or diesel fuel) safety container.

(11) Disconnect rubber fuel fill hose at fuel tank (Fig. 35).

(12) Gas Powered Engines:

(a) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel pump module (Fig. 36) or (Fig. 37).

(b) If equipped with 26 or 34 gallon fuel tank, two EVAP lines are connected to rollover valves. Disconnect EVAP line from rollover valve at top of module (Fig. 36). Disconnect other EVAP line from rollover valve near rear of tank (Fig. 36).

(c) If equipped with 35 gallon fuel tank, two EVAP lines are connected to rollover valves. Disconnect EVAP lines from rollover valves at top-front and top-rear of fuel tank (Fig. 38).

(d) Disconnect fuel supply line at fuel filter/fuel pressure regulator supply fitting (Fig. 36) or (Fig. 37). Refer to Quick-Connect Fittings for procedures.

(13) Diesel Powered Engines:

(a) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel tank module (Fig. 39).

(b) Disconnect fuel supply and fuel return lines at the fuel tank module fittings (Fig. 39). Refer to Quick-Connect Fittings for procedures.

(14) Gasoline Engines: If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation in this group. Diesel Engines: If fuel tank module removal is necessary, refer to Fuel Tank Module Removal/Installation in this group.

80b0d726

Fig. 35 Fuel Tank Mounting—Typical

- 1 - STRAP MOUNTING STUDS (AT FRAME)
- 2 - FUEL FILL HOSE
- 3 - FUEL VENT HOSE
- 4 - STRAP MOUNTING NUTS (2)
- 5 - FUEL TANK STRAPS (2)
- 6 - FUEL TANK
- 7 - CLAMPS

INSTALLATION

(1) Gasoline Engines: If fuel pump module is being installed, refer to Fuel Pump Module Removal/Installation in this group. Diesel Engines: If fuel tank module is being installed, refer to Fuel Tank Module Removal/Installation in this group.

(2) Place fuel tank on top of transmission jack.

(3) Install rubber fill and vent lines to tank. Tighten hose clamps to 2.3 N·m (20 in. lbs.) torque.

(4) Raise tank into position while guiding fill and vent hoses to body. Raise tank only enough to allow access to top of tank.

(5) Gas Powered Engines:

(a) Connect electrical connector to fuel pump module.

(b) Connect EVAP hoses at rollover valves.

(c) Connect fuel supply line at fuel filter/fuel pressure regulator. Refer to Quick-Connect Fittings for procedures.

(6) Diesel Powered Engines:

(a) Connect electrical connector to fuel tank module.

FUEL TANK (Continued)

- 6 - ROLLOVER VALVE

(b) Connect fuel supply and fuel return lines to fuel tank module fittings. Refer to Quick-Connect Fittings in this group.

FUEL TANK (Continued)

- (7) Connect two mounting straps and mounting strap nuts.
- (8) Tighten strap nuts to 41 N·m (30 ft. lbs.) torque. Do not over tighten retaining strap nuts.
- (9) Remove transmission jack.
- (10) Connect fuel filler tube assembly to body.
- (11) If equipped, connect grounding wire (strap) and screw.
- (12) Refill fuel tank and inspect all hoses and lines for leaks.
- (13) Connect negative battery cable(s) to battery(s).

INLET FILTER

REMOVAL

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 40). The fuel pump module is located inside of fuel tank.

Fig. 40 Fuel Pump Inlet Filter

80a61216

- 1 - FUEL PUMP INLET FILTER
- 2 - LOCK TABS (2)
- 3 - FUEL PUMP MODULE (BOTTOM)

- (1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.
- (2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.
- (3) Remove filter by carefully prying 2 lock tabs at bottom of module with 2 screwdrivers. Filter is snapped to module.
- (4) Clean bottom of pump module.

INSTALLATION

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 40). The fuel pump module is located inside of fuel tank.

- (1) Snap new filter to bottom of module. Be sure o-ring is in correct position.

(2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Install fuel tank. Refer to Fuel Tank Removal/Installation.

QUICK CONNECT FITTING

DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to Quick-Connect Fittings Removal/Installation for more information.

CAUTION: The interior components (o-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURES - QUICK-CONNECT FITTINGS

Also refer to Fuel Tubes/Lines/Hoses and Clamps.

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Safety latch clips are used on certain components/lines. Certain fittings may require use of a special tool for disconnection.

DISCONNECTING

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSE, FITTING OR LINE, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

CAUTION: The interior components (o-rings, spacers) of some types of quick-connect fitting are not serviced separately. If service parts are not available, do not attempt to repair a damaged fitting or fuel line. If repair is necessary, replace complete fuel line assembly.

- (1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.
- (2) Disconnect negative battery cable from battery.

QUICK CONNECT FITTING (Continued)

(3) Clean fitting of any foreign material before disassembly.

(4) **Single-Tab Type Fitting:** This type of fitting is equipped with a single pull tab (Fig. 41). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component.

(a) Press release tab on side of fitting to release pull tab (Fig. 42). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

(b) While pressing release tab on side of fitting, use screwdriver to pry up pull tab (Fig. 42).

(c) Raise pull tab until it separates from quick-connect fitting (Fig. 43).

(5) **Two-Tab Type Fitting:** This type of fitting is equipped with tabs located on both sides of fitting (Fig. 44). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

Fig. 41 Single-Tab Type Fitting

- 1 - PULL TAB
- 2 - QUICK-CONNECT FITTING
- 3 - PRESS HERE TO REMOVE PULL TAB
- 4 - INSERTED TUBE END

(a) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 44) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.

(b) Pull fitting from fuel system component being serviced.

(c) The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

(6) **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 45) usually black in color.

J9414-26

Fig. 43 Removing Pull Tab

- 1 - FUEL TUBE OR FUEL SYSTEM COMPONENT
- 2 - PULL TAB
- 3 - QUICK-CONNECT FITTING
- 4 - FUEL TUBE STOP

(a) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 45). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(b) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(c) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

80b898e5

Fig. 47 Latch Clip—Type 2

- 1 - LATCH CLIP

(7) **Latch Clips:** Depending on vehicle model and engine, 2 different types of safety latch clips are used (Fig. 46) or (Fig. 47). Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

(a) Type 1: Pry up on latch clip with a screwdriver (Fig. 46).

QUICK CONNECT FITTING (Continued)

J9514-6

Fig. 48 Fuel Line Disconnection Using Special Tool

- 1 - SPECIAL FUEL LINE TOOL
- 2 - FUEL LINE
- 3 - FUEL RAIL

(b) Type 2: Separate and unlatch 2 small arms on end of clip (Fig. 47) and swing away from fuel line.

(c) Slide latch clip toward fuel rail while lifting with screwdriver.

(d) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 48). Use tool to release locking fingers in end of line.

(e) With special tool still inserted, pull fuel line from fuel rail.

(f) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(8) Disconnect quick-connect fitting from fuel system component being serviced.

CONNECTING

(1) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(2) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(3) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(4) Continue pushing until a click is felt.

(5) Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.

(6) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(7) Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**

(8) Connect negative cable to battery.

(9) Start engine and check for leaks.

ROLLOVER VALVE**DESCRIPTION**

Diesel Powered Engine: One rollover valve is used. The rollover valve is located on the top of the fuel tank module (Fig. 49). The valve may be serviced separately.

Gasoline Powered Engines: If equipped with a 26 or 34 gallon fuel tank, two rollover valves are used. One of the valves is permanently mounted to the top of fuel tank (Fig. 50). If replacement of this particular valve is necessary, the fuel tank must be replaced. The other rollover valve is located on the top of the fuel pump module (Fig. 50). This valve may be serviced separately. If replacement is necessary, refer to the Removal/Installation section of this group.

If equipped with a 35 gallon fuel tank, two rollover valves are used. Both valves are permanently mounted to the top of fuel tank (Fig. 51). If replacement is necessary, the fuel tank must be replaced.

- 4 - ELECTRICAL CONNECTOR
- 5 - LOCKNUT
- 6 - ROLLOVER VALVE

(1) **Diesel Powered Engine:** One rollover valve is used. The valve is located on top of fuel tank module (Fig. 52) and may be serviced separately.

(a) Disconnect both negative battery cables at both batteries.

(b) Remove fuel filler cap and drain fuel tank.

(c) Remove fuel tank. Refer to Fuel Tank Removal/Installation in Fuel System.

(d) The rollover valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.

(e) Discard old grommet.

ROLLOVER VALVE (Continued)

(2) **Gasoline Powered Engines:** If equipped with a 26 or 34 gallon fuel tank, two rollover valves are used. One of the valves is permanently mounted to top of fuel tank (Fig. 53). If replacement of this particular valve is necessary, fuel tank must be replaced. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System. The other rollover valve is located on top of fuel pump module (Fig. 53). This valve may be serviced separately. Refer to following steps for procedures.

If equipped with a 35 gallon fuel tank, two rollover valves are also used, but both valves are permanently mounted to top of fuel tank (Fig. 54). If replacement is necessary, fuel tank must be replaced. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System.

- (a) Disconnect negative battery cable at battery.
- (b) Remove fuel filler cap and drain fuel tank.
- (c) Remove fuel tank. Refer to Fuel Tank Removal/Installation in Fuel System.
- (d) Disconnect tube (line) at valve.
- (e) The rollover valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.
- (f) Discard old grommet.

INSTALLATION

- (1) Install new grommet into fuel pump (or fuel tank) module.
- (2) Using finger pressure only, press valve into place.
- (3) Install fuel tank. Refer to Fuel Tank Installation.
- (4) Fill fuel tank. Install fuel tank filler cap.
- (5) Connect negative battery cable(s).
- (6) Start vehicle and check for leaks.

FUEL INJECTION - GASOLINE

VISUAL INSPECTION—3.9L/5.2L/5.9L
ENGINES

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify that the three 32-way electrical connectors are fully inserted into the connector of the powertrain control module (PCM) (Fig. 1).

(2) Inspect the battery cable connections. Be sure that they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect the ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 2). Refer to label on PDC cover for relay location.

(4) Inspect ignition coil connections. Verify that coil secondary cable is firmly connected to coil (Fig. 3).

FUEL INJECTION - GASOLINE (Continued)

Fig. 1 Powertrain Control Module (PCM)

- 1 - PCM MOUNTING BOLTS (3)
- 2 - POWERTRAIN CONTROL MODULE (PCM)
- 3 - (3) 32-WAY CONNECTORS

Fig. 2 Power Distribution Center (PDC)

- 1 - POWER DISTRIBUTION CENTER (PDC)

(5) Verify that distributor cap is correctly attached to distributor. Be sure that spark plug cables are firmly connected to the distributor cap and the spark plugs are in their correct firing order. Be sure that coil cable is firmly connected to distributor cap and coil. Be sure that camshaft position sensor wire connector (at the distributor) is firmly connected to harness connector. Inspect spark plug condition. Refer to 8, Ignition. Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(6) Verify that generator output wire, generator connector and ground wire are firmly connected to the generator.

Fig. 3 Ignition Coil—3.9L/5.2L/5.9L Engines—Typical

- 1 - ACCESSORY DRIVE BELT TENSIONER
- 2 - COIL CONNECTOR
- 3 - IGNITION COIL
- 4 - COIL MOUNTING BOLTS

(7) Inspect the system body grounds for loose or dirty connections. Refer to 8, Wiring for ground locations.

(8) Verify positive crankcase ventilation (PCV) valve operation. Refer to 25, Emission Control System for additional information. Verify PCV valve hose is firmly connected to PCV valve and manifold (Fig. 4).

Fig. 4 PCV Valve

- 1 - PCV VALVE
- 2 - PCV VALVE HOSE CONNECTIONS

(9) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

(10) Verify that hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

FUEL INJECTION - GASOLINE (Continued)

(11) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to the throttle arm of throttle body for any binding or restrictions.

(12) If equipped with vacuum brake booster, verify that vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(13) Inspect the air cleaner inlet and air cleaner element for dirt or restrictions.

(14) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(15) Verify that the intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 5).

Fig. 5 Air Temperature

- 1 - INTAKE MANIFOLD AIR TEMPERATURE SENSOR
- 2 - ELECTRICAL CONNECTOR

(16) Verify that MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 6). Also verify that rubber L-shaped fitting from MAP sensor to the throttle body is firmly connected (Fig. 7).

(17) Verify that fuel injector wire harness connectors are firmly connected to injectors in the correct order. Each harness connector is numerically tagged with the injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(18) Verify harness connectors are firmly connected to idle air control (IAC) motor, throttle position sensor (TPS) and manifold absolute pressure (MAP) sensor (Fig. 6).

(19) Verify that wire harness connector is firmly connected to the engine coolant temperature sensor (Fig. 8).

(20) Raise and support the vehicle.

Fig. 6 Sensor and IAC Motor Location—Typical (V-8 Shown)

- 3 - IDLE AIR PASSAGE

(21) Verify oxygen sensor wire connectors are firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 9), (Fig. 10) or (Fig. 11).

(22) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

Fig. 11 Oxygen Sensors

sor is firmly attached to rear axle with proper air gap. Refer to 5, Brakes for information.

(26) If equipped with 4-wheel antilock brake system, verify electrical harness is firmly connected to each front wheel speed sensor. Verify both front wheel speed sensors are firmly attached. Refer to 5, Brakes for information.

(27) Verify that fuel pump/gauge sender unit wire connector is firmly connected to harness connector.

(28) Inspect fuel hoses at fuel pump/gauge sender unit for cracks or leaks.

(29) Inspect transmission torque convertor housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(30) Verify that battery cable and solenoid feed wire connections to the starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

FUEL INJECTION - GASOLINE (Continued)

VISUAL INSPECTION—8.0L ENGINE

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify that the three 32-way electrical connectors are fully inserted into the connector of the powertrain control module (PCM) (Fig. 12).

Fig. 12 Powertrain Control Module (PCM)

- 1 - PCM MOUNTING BOLTS (3)
- 2 - POWERTRAIN CONTROL MODULE (PCM)
- 3 - (3) 32-WAY CONNECTORS

(2) Inspect the battery cable connections. Be sure that they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect the ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 13). Refer to label on PDC cover for relay location.

(4) Inspect ignition coil pack primary connections. Verify that secondary cables are firmly connected to coils (Fig. 14).

(5) Be sure that spark plug cables are firmly connected and the spark plugs are in their correct firing order. Be sure that camshaft position sensor wire connector is firmly connected to harness connector. Inspect spark plug condition. Refer to 8, Ignition. Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(6) Verify that generator output wire, generator connector and ground wire are firmly connected to the generator.

Fig. 13 Power Distribution Center (PDC)

- 1 - POWER DISTRIBUTION CENTER (PDC)

Fig. 14 Ignition Coil Pack—8.0L Engine

(7) Inspect the system body grounds for loose or dirty connections. Refer to 8, Wiring for ground locations.

(8) Verify crankcase ventilation (CCV) operation. Refer to 25, Emission Control System for additional information.

(9) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

(10) Verify that hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

(11) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to the throttle arm of throttle body for any binding or restrictions.

FUEL INJECTION - GASOLINE (Continued)

(12) If equipped with vacuum brake booster, verify that vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(13) Inspect the air cleaner inlet and air cleaner element for dirt or restrictions.

(14) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(15) Verify that the intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 15).

Fig. 15 Air Temperature Sensor—8.0L Engine

- 1 - INTAKE MANIFOLD AIR TEMP. SENSOR
- 2 - INTAKE MANIFOLD

(16) Verify that MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 16).

Fig. 16 Map Sensor —8.0L Engine

- 1 - MAP SENSOR
- 2 - MOUNTING BOLTS
- 3 - THROTTLE BODY

(17) Verify that fuel injector wire harness connectors are firmly connected to injectors in the correct order. Each harness connector is numerically tagged with the injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(18) Verify harness connectors are firmly connected to idle air control (IAC) motor and throttle position sensor (TPS).

(19) Verify that wire harness connector is firmly connected to the engine coolant temperature sensor (Fig. 17).

Fig. 17 Engine Coolant Temperature Sensor—8.0L Engine

- 1 - ENGINE COOLANT TEMP. SENSOR
- 2 - THERMOSTAT HOUSING
- 3 - GENERATOR

(20) Raise and support the vehicle.

(21) Verify that all oxygen sensor wire connectors are firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 18), (Fig. 19) or (Fig. 20).

(22) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

(23) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic converter.

(24) If equipped with automatic transmission, verify that electrical harness is firmly connected to park/neutral switch. Refer to 21, Automatic Transmission.

(25) Verify electrical harness is firmly connected to rear wheel speed sensor. Verify rear wheel speed sensor is firmly attached to rear axle with proper air gap. Refer to 5, Brakes for information.

(26) If equipped with 4-wheel antilock brake system, verify electrical harness is firmly connected to each front wheel speed sensor. Verify both front wheel speed sensors are firmly attached. Refer to 5, Brakes for information.

(27) Verify that fuel pump/gauge sender unit wire connector is firmly connected to harness connector.

(28) Inspect fuel hoses at fuel pump/gauge sender unit for cracks or leaks.

(29) Inspect transmission torque converter housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(30) Verify that battery cable and solenoid feed wire connections to the starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

ACCELERATOR PEDAL

REMOVAL

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 21). The plastic cable retainer snaps into pedal arm.

Fig. 21 Cable Removal/Installation at Pedal

- 1 - PINCH TWO TABS FOR CABLE REMOVAL
- 2 - DASH PANEL
- 3 - CABLE CORE WIRE
- 4 - THROTTLE PEDAL ARM
- 5 - INDEX TAB
- 6 - CABLE RETAINER
- 7 - CABLE STOP

(2) Insert a small screwdriver into square holes located on pivots/bushings (Fig. 22). Twist screwdriver to disengage pivot locks from pivot pin. Pivots will be damaged when removing. Discard old pivots.

(3) Remove pedal/bracket assembly from vehicle.

J9414-40

Fig. 22 Accelerator Pedal—Removal or Installation

- 1 - PEDAL MOUNTING BRACKET
- 2 - PIVOTS/BUSHINGS
- 3 - PEDAL/BACKET
- 4 - PIVOT PIN

INSTALLATION

(1) Position pedal/bracket assembly over pivot pin (Fig. 22).

(2) Install two new pivots/bushings. Using large pliers, press both bushings together until they bottom on sides of pedal/bracket assembly. Bushing retaining ears will snap into position when properly installed.

(3) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 21). Align index slot on plastic cable retainer to this index tab.

CRANKSHAFT POSITION SENSOR

DESCRIPTION - 3.9L

The Crankshaft Position (CKP) sensor is located near the outer edge of the flywheel (starter ringear).

DESCRIPTION - 5.2L/5.9L

The Crankshaft Position (CKP) sensor is located near the outer edge of the flywheel (starter ringear).

DESCRIPTION - 8.0L

The Crankshaft Position (CKP) sensor is located on the right-lower side of the cylinder block, forward of the right engine mount, just above the oil pan rail (Fig. 23).

Fig. 23 CKP Sensor Location—8.0L V-10 Engine

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - HOLE
- 3 - OIL FILTER
- 4 - PLASTIC TIE STRAP
- 5 - PIGTAIL HARNESS

OPERATION - 3.9L

Engine speed and crankshaft position are provided through the CKP sensor. The sensor generates pulses that are the input sent to the Powertrain Control Module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

The flywheel/drive plate has groups of notches at its outer edge. On 3.9L V-6 engines, there are three sets of double notches and three sets of single notches (Fig. 24).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM.

The engine will not operate if the PCM does not receive a CKP sensor input.

Fig. 24 CKP Sensor Operation—3.9L Engine

- 1 - FLYWHEEL
- 2 - NOTCHES
- 3 - CRANKSHAFT POSITION SENSOR

OPERATION - 5.2L/5.9L

Engine speed and crankshaft position are provided through the CKP sensor. The sensor generates pulses that are the input sent to the Powertrain Control Module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On 5.2/5.9L V-8 engines, the flywheel/drive plate has 8 single notches, spaced every 45 degrees, at its outer edge (Fig. 25).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM. For each engine revolution, there are 8 pulses generated on V-8 engines.

CRANKSHAFT POSITION SENSOR (Continued)

The engine will not operate if the PCM does not receive a CKP sensor input.

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - NOTCHES
- 3 - FLYWHEEL

OPERATION - 8.0L

The Crankshaft Position (CKP) sensor detects notches machined into the middle of the crankshaft (Fig. 26).

J948D-8

Fig. 26 CKP Sensor Operation—8.0L V-10 Engine

- 1 - CRANKSHAFT NOTCHES
- 2 - CRANKSHAFT
- 3 - CRANKSHAFT POSITION SENSOR

There are five sets of notches. Each set contains two notches. Basic ignition timing is determined by the position of the last notch in each set of notches. Once the Powertrain Control Module (PCM) senses the last notch, it will determine crankshaft position (which piston will next be at Top Dead Center). An input from the camshaft position sensor is also needed. It may take the module up to one complete engine revolution to determine crankshaft position during engine cranking.

The PCM uses the signal from the camshaft position sensor to determine fuel injector sequence. Once crankshaft position has been determined, the PCM begins energizing a ground circuit to each fuel injector to provide injector operation.

REMOVAL - 3.9L/5.2L/5.9L

The sensor is bolted to the top of the cylinder block near the rear of right cylinder head (Fig. 27).

- (1) Apply a small amount of engine oil to sensor o-ring (Fig. 30).
- (2) Install sensor into cylinder block with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block (Fig. 29). If sensor is not flush, damage to sensor mounting tang may result.

- (3) Install mounting bolt and tighten to 8 N·m (70 in. lbs.) torque.
- (4) Connect sensor pigtail harness to main engine wiring harness

CRANKSHAFT POSITION SENSOR (Continued)

(5) Install new plastic tie strap (Fig. 28) to secure sensor pigtail harness to side of engine block. Thread tie strap through casting hole on cylinder block.

FUEL PUMP RELAY

DESCRIPTION

The 5-pin, 12-volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

OPERATION

The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shut-down the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

REMOVAL

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 31). Refer to label on PDC cover for relay location.

Fig. 31 Power Distribution Center (PDC)

1 - POWER DISTRIBUTION CENTER (PDC)

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 31). Refer to label on PDC cover for relay location.

- (1) Install relay to PDC.
- (2) Install cover to PDC.

IDLE AIR CONTROL MOTOR

DESCRIPTION

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

OPERATION

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

IDLE AIR CONTROL MOTOR (Continued)

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

IAC Stepper Motor Program: The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a "No-Load" engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

REMOVAL - 3.9L/5.2L/5.9L

The IAC motor is located on the back of the throttle body (Fig. 32).

- (1) Remove air cleaner assembly.
- (2) Disconnect electrical connector from IAC motor.
- (3) Remove two mounting bolts (screws) (Fig. 32).
- (4) Remove IAC motor from throttle body.

J9214-23

INSTALLATION - 3.9L/5.2L/5.9L

The IAC motor is located on the back of the throttle body (Fig. 32).

IDLE AIR CONTROL MOTOR (Continued)

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N-m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner assembly.

INSTALLATION - 8.0L

The IAC motor is located on the back of the throttle body (Fig. 33).

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N-m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner housing to throttle body.
- (5) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N-m (96 in. lbs.) torque.
- (6) Install air cleaner housing cover.

INTAKE AIR TEMPERATURE SENSOR

DESCRIPTION - 3.9L/5.2L/5.9L/8.0L

The 2-wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION - 3.9L/5.2L/5.9L/8.0L

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5-volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

REMOVAL - 3.9L/5.2L/5.9L

The intake manifold air temperature sensor is located in the front/side of the intake manifold (Fig. 34).

- (1) Remove air cleaner assembly.
- (2) Disconnect electrical connector at sensor (Fig. 34).
- (3) Remove sensor from intake manifold.

INSTALLATION - 3.9L/5.2L/5.9L

The intake manifold air temperature sensor is located in the front/side of the intake manifold (Fig. 34).

INTAKE AIR TEMPERATURE SENSOR (Continued)

- (1) Install sensor to intake manifold. Tighten to 12–15 N·m (110–130 in. lbs.) torque.
- (2) Install electrical connector.
- (3) Install air cleaner.

INSTALLATION - 8.0L

The intake manifold air temperature sensor is located in the side of the intake manifold near the front of throttle body (Fig. 35).

- (1) Install sensor to intake manifold. Tighten to 12–15 N·m (110–130 in. lbs.) torque.
- (2) Install electrical connector.

MANIFOLD ABSOLUTE PRESSURE SENSOR**DESCRIPTION - 3.9L/5.2L/5.9L/8.0L**

On 3.9L/5.2L/5.9L engines, the MAP sensor is mounted on the side of the engine throttle body. The sensor is connected to the throttle body with a rubber L-shaped fitting.

On the 8.0L 10-cylinder engine, the MAP sensor is mounted into the right side of the intake manifold.

OPERATION - 3.9L/5.2L/5.9L/8.0L

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage

again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops .10 in. Hg. If a storm goes through it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

MANIFOLD ABSOLUTE PRESSURE SENSOR (Continued)

REMOVAL - 3.9L/5.2L/5.9L

The MAP sensor is located on the front of the throttle body (Fig. 36). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 37).

Fig. 36 MAP Sensor Location—3.9L/5.2L/5.9L Engines

- 1 - MAP SENSOR
2 - MOUNTING SCREWS (2)

Fig. 37 MAP Sensor L-Shaped Rubber Fitting—3.9L/5.2L/5.9L Engines

- 1 - MAP SENSOR
2 - RUBBER FITTING
3 - IDLE AIR PASSAGE

The MAP sensor is located on the front of the throttle body (Fig. 36). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 37).

- (1) Remove air cleaner assembly.
- (2) Remove two MAP sensor mounting bolts (screws) (Fig. 36).
- (3) While removing MAP sensor, slide the vacuum rubber L-shaped fitting (Fig. 37) from the throttle body.
- (4) Remove rubber L-shaped fitting from MAP sensor.

REMOVAL - 8.0L

The MAP sensor is mounted into the right upper side of the intake manifold (Fig. 38). A rubber gasket is used to seal the sensor to the intake manifold. The rubber gasket is part of the sensor and is not serviced separately.

- (1) Remove the electrical connector at the sensor.
- (2) Clean the area around the sensor before removal.
- (3) Remove the two sensor mounting bolts.
- (4) Remove the sensor from the intake manifold.

Fig. 38 MAP Sensor Location—8.0L V-10 Engine—Typical

- 1 - MAP SENSOR
2 - MOUNTING BOLTS
3 - THROTTLE BODY

INSTALLATION - 3.9L/5.2L/5.9L

The MAP sensor is located on the front of the throttle body (Fig. 36). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 37).

- (1) Install rubber L-shaped fitting to MAP sensor.
- (2) Position sensor to throttle body while guiding rubber fitting over throttle body vacuum nipple.

MANIFOLD ABSOLUTE PRESSURE SENSOR (Continued)

- (3) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.
- (4) Install air cleaner.

INSTALLATION - 8.0L

The MAP sensor is mounted into the right upper side of the intake manifold (Fig. 38). A rubber gasket is used to seal the sensor to the intake manifold. The rubber gasket is part of the sensor and is not serviced separately.

- (1) Check the condition of the sensor seal. Clean the sensor and lubricate the rubber gasket with clean engine oil.
- (2) Clean the sensor opening in the intake manifold.
- (3) Install the sensor into the intake manifold.
- (4) Install sensor mounting bolts. Tighten bolts to 2 N·m (20 in. lbs.) torque.
- (5) Install the electrical connector to sensor.

O2 SENSOR**DESCRIPTION**

The Oxygen Sensors (O2S) are attached to, and protrude into the vehicle exhaust system. Depending on the emission package, the vehicle may use a total of either 2 or 4 sensors.

3.9L/5.2L/Light Duty 5.9L Engine: Four sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the right upstream sensor (2/1) is located in the right exhaust downpipe just before the mini-catalytic converter. The left upstream sensor (1/1) is located in the left exhaust downpipe just before the mini-catalytic converter. The right downstream sensor (2/2) is located in the right exhaust downpipe just after the mini-catalytic converter, and before the main catalytic converter. The left downstream sensor (1/2) is located in the left exhaust downpipe just after the mini-catalytic converter, and before the main catalytic converter.

Medium and Heavy Duty 8.0L V-10 Engine: Four sensors are used (2 upstream, 1 pre-catalyst and 1 post-catalyst). With this emission package, the 1/1 upstream sensor (left side) is located in the left exhaust downpipe before both the pre-catalyst sensor (1/2), and the main catalytic converter. The 2/1 upstream sensor (right side) is located in the right exhaust downpipe before both the pre-catalyst sensor (1/2), and the main catalytic converter. The pre-catalyst sensor (1/2) is located after the 1/1 and 2/1 sensors, and just before the main catalytic converter. The post-catalyst sensor (1/3) is located just after the main catalytic converter.

Heavy Duty 5.9L Engine: Two sensors are used. They are **both** referred to as upstream sensors (left side is referred to as 1/1 and right side is referred to as 2/1). With this emission package, a sensor is located in each of the exhaust downpipes before the main catalytic converter.

OPERATION

An O2 sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7-to-1 air/fuel ratio necessary for proper engine operation and to control emissions.

The O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the wire harness. This is why it is important to never solder an O2 sensor connector, or pack the connector with grease.

Four wires (circuits) are used on each O2 sensor: a 12-volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

Oxygen Sensor Heaters/Heater Relays: Depending on the emissions package, the heating elements within the sensors will be supplied voltage from either the ASD relay, or 2 separate oxygen sensor relays. Refer to 8, Wiring Diagrams to determine which relays are used.

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures around 70°F, the resistance of the heating element is approximately 4.5 ohms. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based

O2 SENSOR (Continued)

on preprogrammed (fixed) values and inputs from other sensors.

Upstream Sensors: Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Downstream Sensors: Two downstream sensors are used (1/2 and 2/2). The downstream sensors are used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage, and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Medium and Heavy Duty 8.0L V-10 Engine: Four oxygen sensors are used (2 upstream, 1 pre-catalyst and 1 post-catalyst). The upstream sensors (1/1 and 2/1) will fine-tune the air-fuel ratio through the Powertrain Control Module (PCM). The pre-catalyst (1/2) and post-catalyst (1/3) sensors will determine catalytic convertor efficiency (efficiency of the main catalytic convertor). This is also done through the PCM.

Heavy Duty 5.9L Engine: Downstream sensors are not used with this emissions package, meaning catalytic convertor efficiency is not calculated with this package. Two upstream sensors are used. The left upstream sensor (1/1) will monitor cylinders 1, 3, 5 and 7. The right upstream sensor (2/1) will monitor cylinders 2, 4, 6 and 8. The PCM monitors the oxygen content of the sensors, and will fine-tune the air-fuel ratio.

Engines equipped with either a downstream sensor(s), or a post-catalytic sensor, will monitor catalytic convertor efficiency. If efficiency is below emission standards, the Malfunction Indicator Lamp (MIL) will be illuminated and a Diagnostic Trouble Code (DTC) will be set. Refer to Monitored Systems in Emission Control Systems for additional information.

REMOVAL

Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness. For sensor operation, it must have a comparison source of oxygen from outside the exhaust system. This fresh air is supplied to the sensor through its pigtail wiring harness.

The O2S (oxygen sensors) are numbered 1/1, 1/2, 1/3, 2/1 and 2/2.

On HDC engines, the pre-catalyst/post catalyst O2S sensors are located at the inlet and outlet ends of the catalytic converter (Fig. 39).

The 1/1 and 2/1 sensors are located before the mini-cats (Fig. 40). The 1/2 and 2/2 sensors are located after the mini-cats (Fig. 40).

Fig. 40 Oxygen Sensors—5.2L/5.9L California Engines

O2 SENSOR (Continued)

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

- (1) Raise and support the vehicle.
- (2) Disconnect the wire connector from the O2S sensor.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

- (3) Remove the O2S sensor with an oxygen sensor removal and installation tool.

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to the threads of a new oxygen sensor.**

- (1) Install the O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.
- (2) Connect the O2S sensor wire connector.
- (3) Lower the vehicle.

PTO SWITCH

DESCRIPTION

This Powertrain Control Module (PCM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

OPERATION

The input is used only to tell the PCM that the PTO has been engaged. The PCM will disable (temporarily shut down) certain OBD II diagnostic trouble codes when the PTO is engaged.

When the aftermarket PTO switch has been engaged, a 12V + signal is sent through circuit G113 to PCM pin A13. The PCM will then sense and determine that the PTO has been activated.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

REMOVAL - 3.9L/5.2L/5.9L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

- (1) Remove the air cleaner.
- (2) Disconnect throttle body electrical connectors at MAP sensor, IAC motor and TPS (Fig. 41).

Fig. 41 Sensor Electrical Connectors—3.9L/5.2L/5.9L Engines—Typical

- 1 - MAP SENSOR
- 2 - IDLE AIR CONTROL MOTOR
- 3 - THROTTLE POSITION SENSOR

- (3) Remove vacuum line at throttle body.
- (4) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section of this group for additional information.

THROTTLE BODY (Continued)

(5) Remove four throttle body mounting bolts (Fig. 42).

Fig. 42 Throttle Body

- 1 - THROTTLE BODY MOUNTING BOLTS (4)
2 - THROTTLE BODY

(6) Remove throttle body from intake manifold.
(7) Discard old throttle body-to-intake manifold gasket.

REMOVAL - 8.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

- (1) Remove the air cleaner cover.
- (2) Remove the 4 air cleaner housing mounting nuts and remove housing from throttle body.
- (3) Disconnect throttle body electrical connectors at the IAC motor and TPS.
- (4) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section of this group for additional information.
- (5) Remove four throttle body mounting nuts (Fig. 43).
- (6) Remove throttle body from intake manifold.
- (7) Discard old throttle body-to-intake manifold gasket.

INSTALLATION - 3.9L/5.2L/5.9L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle

2 - GASKET
3 - THROTTLE BODY
4 - MOUNTING NUTS (4)

plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

- (1) Clean the mating surfaces of the throttle body and the intake manifold.
- (2) Install new throttle body-to-intake manifold gasket.
- (3) Install throttle body to intake manifold.
- (4) Install four mounting bolts. Tighten bolts to 23 N·m (200 in. lbs.) torque.
- (5) Install control cables.
- (6) Install vacuum line to throttle body.
- (7) Install electrical connectors.
- (8) Install air cleaner.

INSTALLATION - 8.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

- (1) Clean the mating surfaces of the throttle body and the intake manifold.
- (2) Install new throttle body-to-intake manifold gasket.
- (3) Install throttle body to intake manifold.
- (4) Install four mounting nuts. Tighten nuts to 22 N·m (192 in. lbs.) torque.

THROTTLE BODY (Continued)

- (5) Install control cables.
- (6) Install electrical connectors.
- (7) Install air cleaner housing to throttle body.
- (8) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.
- (9) Install air cleaner housing cover.

THROTTLE CONTROL CABLE

REMOVAL

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

(1) From inside the vehicle, hold up the accelerator pedal. Remove the plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 21). The plastic cable retainer snaps into pedal the arm.

(2) Remove the cable core wire at the pedal arm.

(3) Remove the air cleaner housing.

(4) From inside the vehicle, pinch both sides of the plastic cable housing retainer tabs at the dash panel (Fig. 21).

(5) Remove cable housing from dash panel and pull the cable into the engine compartment.

(6) **3.9L/5.2L/5.9L Engines:** Disconnect the cable from the routing/holddown clip at the radiator fan shroud.

(7) **8.0L V-10 Engine:** Remove the throttle cable socket at throttle lever ball. (Fig. 45) (snaps off).

(8) **3.9L/5.2L/5.9L Engines:** Slip the cable end rearward from pin on throttle body (Fig. 44).

(9) Remove cable housing at throttle body mounting bracket by pressing on release tab with a small screwdriver (Fig. 46) or (Fig. 45). **To prevent cable housing breakage, press on the tab only enough to release the cable from the bracket.** Lift the cable housing straight up from bracket while pressing on release tab. Remove throttle cable from vehicle.

INSTALLATION

(1) **3.9L/5.2L/5.9L Engines:**

(a) Rotate and hold the throttle cam in the full wide open position. Snap the cable end onto lever pin (Fig. 44).

(b) Connect cable to throttle body mounting bracket (push down and lock).

(c) Connect cable to fan shroud routing clip.

(2) **8.0L V-10 Engine:**

(a) Connect cable end socket to throttle body lever ball (snaps on) (Fig. 45).

(b) Connect cable to throttle body mounting bracket (push down and lock).

THROTTLE CONTROL CABLE (Continued)

**Fig. 46 Cable Release**

1 - TAB

(3) Install the remaining cable housing end into and through the dash panel opening (snaps into position). The two plastic pinch tabs (Fig. 21) should lock the cable to dash panel.

(4) From inside the vehicle, hold up the accelerator pedal. Install the throttle cable core wire and plastic cable retainer into and through the upper end of the pedal arm (the plastic retainer is snapped into the pedal arm). When installing the plastic retainer to the accelerator pedal arm, note the index tab on the pedal arm (Fig. 21). Align the index slot on the plastic cable retainer to this index tab.

THROTTLE POSITION SENSOR

DESCRIPTION

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade.

OPERATION

The TPS is a 3-wire variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance (output voltage) of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
- Deceleration fuel lean out
- Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
- A/C WOT cutoff (certain automatic transmissions only)

REMOVAL - 3.9L/5.2L/5.9L

The TPS is located on the side of the throttle body.

- (1) Remove air intake tube at throttle body.
- (2) Disconnect TPS electrical connector.
- (3) Remove two TPS mounting bolts (Fig. 47).

**Fig. 47 TPS Mounting Bolts—3.9L/5.2L/5.9L Engines**

- 1 - THROTTLE POSITION SENSOR
- 2 - MOUNTING SCREWS

- (4) Remove TPS from throttle body.

THROTTLE POSITION SENSOR (Continued)

REMOVAL - 8.0L

The TPS is located on the side of the throttle body (Fig. 48).

- (1) Remove air intake tube at air cleaner housing.
- (2) Remove the air cleaner cover.
- (3) Remove the 4 air cleaner housing mounting nuts and remove housing from throttle body.
- (4) Disconnect TPS electrical connector.
- (5) Remove two TPS mounting bolts (Fig. 48).

J9414-3

Fig. 48 TPS Mounting Bolts—8.0L Engine

- 1 - MOUNTING BOLTS (2)
- 2 - IDLE AIR CONTROL MOTOR
- 3 - THROTTLE POSITION SENSOR
- 4 - THROTTLE BODY

- (6) Remove TPS from throttle body.

INSTALLATION - 3.9L/5.2L/5.9L

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 49). The TPS must be installed so that it can be rotated a few degrees. If the sensor will not rotate, install the sensor with the throttle shaft on the other side of the socket tangs. The TPS will be under slight tension when rotated.

- (1) Install the TPS and two retaining bolts.
- (2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
- (3) Manually operate the throttle control lever by hand to check for any binding of the TPS.
- (4) Connect TPS electrical connector to TPS.
- (5) Install air intake tube.

INSTALLATION - 8.0L

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 50). The TPS must be

J9214-52

Fig. 50 Installation—Typical Mounting

- 1 - THROTTLE BODY
- 2 - THROTTLE POSITION SENSOR
- 3 - THROTTLE SHAFT
- 4 - SOCKET LOCATING TANGS

- (1) Install the TPS and two retaining bolts.
- (2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
- (3) Manually operate the throttle control lever by hand to check for any binding of the TPS.
- (4) Connect TPS electrical connector to TPS.
- (5) Install air cleaner housing to throttle body.
- (6) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.
- (7) Install air cleaner housing cover.
- (8) Install air intake tube to cover.

FUEL INJECTOR

DESCRIPTION

A separate fuel injector (Fig. 51) is used for each individual cylinder.

Fig. 51 Fuel Injector

- 1 - FUEL INJECTOR
- 2 - NOZZLE
- 3 - TOP (FUEL ENTRY)

OPERATION

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

An individual fuel injector is used for each individual cylinder. The top (fuel entry) end of the injector is attached into an opening on the fuel rail.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

OPERATION - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

DIAGNOSIS AND TESTING - FUEL INJECTOR TEST

To perform a complete test of the fuel injectors and their circuitry, use the DRB scan tool and refer to the appropriate Powertrain Diagnostics Procedures manual. To test the injector only, refer to the following:

Disconnect the fuel injector wire harness connector from the injector. The injector is equipped with 2 electrical terminals (pins). Place an ohmmeter across the terminals. Resistance reading should be approximately 12 ohms ± 1.2 ohms at 20°C (68°F).

REMOVAL

- (1) Remove air cleaner assembly.
- (2) Remove fuel injector rail assembly. Refer to Fuel Injector Rail removal in this section.
- (3) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 30) or (Fig. 31).
- (4) Remove injector(s) from fuel rail.

INSTALLATION

- (1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.
- (2) Install injector(s) and injector clip(s) to fuel rail.
- (3) Install fuel rail assembly. Refer to Fuel Injector Rail installation.
- (4) Install air cleaner.
- (5) Start engine and check for leaks.

FUEL DELIVERY - DIESEL

DESCRIPTION - DIESEL FUEL DELIVERY SYSTEM

The fuel system on the Cummins 24 valve—Turbo Diesel Engine uses an **electronic** fuel injection pump with three control modules.

Also refer to the Powertrain Control Module (PCM) or Engine Control Module sections.

Some fuel system components are shown in (Fig. 1).

The fuel delivery system consists of the:

- Accelerator pedal
- Air cleaner housing/element
- Fuel drain manifold (passage)

 - Throttle cable
 - Water draining

OPERATION

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 120,000 KPA (17,405 PSI). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING - AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock. After service is performed, air must be bled from the system before starting the engine.

Inspect the fuel system from the fuel transfer pump to the injectors for loose connections. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the transfer pump. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

For air bleeding, refer to the Air Bleed Procedure.

DIAGNOSIS AND TESTING - FUEL SUPPLY RESTRICTIONS

LOW-PRESSURE LINES

Fuel supply line restrictions or a defective fuel transfer pump can cause starting problems and prevent engine from accelerating. The starting problems include; low power and/or white fog like exhaust.

Test all fuel supply lines for restrictions or blockage. Flush or replace as necessary. Bleed fuel system of air once a fuel supply line has been replaced. Refer to Air Bleed Procedure for procedures.

To test for fuel line restrictions, a vacuum restriction test may be performed. Refer to Fuel Transfer Pump Pressure Test.

HIGH-PRESSURE LINES

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance, engine mis-fire and white smoke from exhaust.

Examine all high-pressure lines for any damage. Each radius on each high-pressure line must be smooth and free of any bends or kinks.

Replace damaged, restricted or leaking high-pressure fuel lines with correct replacement line.

CAUTION: All high-pressure fuel lines must be clamped securely in place in holders. Lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If line is kinked or bent, it must be replaced. Use only recommended lines when replacement of high-pressure fuel line is necessary.

STANDARD PROCEDURES - WATER DRAINING AT FUEL FILTER

Refer to Fuel Filter/Water Separator removal/installation for procedures.

FUEL DELIVERY - DIESEL (Continued)

STANDARD PROCEDURES - CLEANING FUEL SYSTEM PARTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

STANDARD PROCEDURE - AIR BLEED

A certain amount of air becomes trapped in the fuel system when fuel system components on the supply and/or high-pressure side are serviced or replaced. Primary air bleeding is accomplished using the electric fuel transfer (lift) pump. If the vehicle has been allowed to run completely out of fuel, the fuel injectors must also be bled as the fuel injection pump **is not** self-bleeding (priming).

Servicing or replacing components on the fuel return side will not require air bleeding.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE.

(1) Loosen, but do not remove, banjo bolt (test port fitting) holding low-pressure fuel supply line to side of fuel injection pump (Fig. 2). Place a shop towel around banjo fitting to catch excess fuel.

The fuel transfer (lift) pump is self-priming: When the key is first turned on (without cranking engine), the pump operates for approximately 2 seconds and then shuts off. The pump will also operate for up to 25 seconds after the starter is quickly engaged, and then disengaged without allowing the engine to start. The pump shuts off immediately if the key is on and the engine stops running.

(2) Turn key to CRANK position and quickly release key to ON position before engine starts. This will operate fuel transfer pump for approximately 25 seconds.

(3) If fuel is not present at fuel supply line after 25 seconds, turn key OFF. Repeat previous step until fuel is exiting at fuel supply line.

Fig. 2 Fuel Supply Line Banjo Bolt

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

(4) Tighten banjo bolt at fuel supply line to 24 N·m (18 ft. lbs.) torque. Primary air bleeding is now completed.

(5) Attempt to start engine. If engine will not start, proceed to following steps. **If engine does start, it may run erratically and be very noisy for a few minutes. This is a normal condition.**

(6) **Continue to next step if:**

- The vehicle fuel tank has been allowed to run empty
- The fuel injection pump has been replaced
- High-pressure fuel lines have been replaced
- Vehicle has not been operated after an extended period

CAUTION: Do not engage the starter motor for more than 30 seconds at a time. Allow two minutes between cranking intervals.

(7) Perform previous air bleeding procedure steps using fuel transfer pump. Be sure fuel is present at fuel supply line (Fig. 2) before proceeding.

(8) Crank the engine for 30 seconds at a time to allow air trapped in the injection pump to vent out the drain manifold.

FUEL DELIVERY - DIESEL (Continued)

WARNING: THE FUEL INJECTION PUMP SUPPLIES EXTREMELY HIGH FUEL PRESSURE TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING AND AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: ENGINE MAY START WHILE CRANKING STARTER MOTOR.

Engine may start, may run erratically and be very noisy for a few minutes. This is a normal condition.

(9) Thoroughly clean area around injector fittings where they join injector connector tubes.

(10) Bleed air by loosening high-pressure fuel line fittings (Fig. 3) at cylinders number 3, 4 and 5.

(11) Continue bleeding injectors until engine runs smoothly. It may take a few minutes for engine to run smooth.

(12) Tighten fuel line(s) at injector(s) to 38 N·m (28 ft. lbs.) torque.

80b46b80

Fig. 3 Bleeding High-Pressure Fuel Lines at Injectors

1 - HIGH-PRESSURE FUEL LINE

SPECIFICATIONS

FUEL SYSTEM PRESSURES—DIESEL ENGINES

DESCRIPTION	PRESSURE
Fuel Transfer (Lift) Pump Pressure With Engine Running	Minimum 69 kPa (10 psi)
Fuel Transfer (Lift) Pump Pressure With Engine Cranking	Minimum 48 kPa (7 psi)
Fuel Injector "Pop Off" Pressure	31,026 kPa (310 bars) or (4500 psi \pm 250 psi)
Fuel Injector Leak-Down Pressure	Approximately 20 bars (291 psi) lower than pop pressure
Fuel Pressure Drop Across Fuel Filter Test Ports	34 kPa max. (5 psi. max.) at 2500 rpm (rated rpm)
Overflow Valve Release Pressure	97 kPa max. (14 psi.) at 2500 rpm (rated rpm)

FUEL FILTER / WATER SEPARATOR

DESCRIPTION

The fuel filter/water separator assembly is located on left side of engine above starter motor (Fig. 4). The assembly also includes the fuel heater and Water-In-Fuel (WIF) sensor.

Fig. 4 Fuel Filter/Water Separator Location

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

OPERATION

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

Refer to the maintenance schedules for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator Removal/Installation section.

A Water-In-Fuel (WIF) sensor is attached to side of canister. Refer to Water-In-Fuel Sensor Description/Operation.

The fuel heater is installed into the top of the filter/separator housing. Refer to Fuel Heater Description/Operation.

FUEL FILTER / WATER SEPARATOR (Continued)

REMOVAL

Refer to maintenance schedules in this manual for recommended fuel filter replacement intervals.

Draining water from fuel filter/water separator housing:

The housing drain valve (Fig. 5) serves two purposes. One is to **partially** drain filter housing of excess water. The other is to **completely** drain housing for fuel filter, drain valve, heater element or water-in-fuel sensor replacement.

The filter housing should be drained whenever water-in-fuel warning lamp remains illuminated. (Note that lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

(1) A drain hose is located at bottom of drain valve (Fig. 5). Place drain pan under drain hose.

(2) **With engine not running**, pull drain valve handle upward to OPEN (DRAIN) position (Fig. 5). Hold drain valve open until all water and contaminants have been removed and clean fuel exits drain hose.

(3) If drain valve, fuel heater element or Water-In-Fuel (WIF) sensor is being replaced, drain housing completely. Dispose of mixture in drain pan according to applicable regulations.

(4) After draining operation, push valve handle downward to CLOSE position (Fig. 5).

Fig. 5 Water Drain Valve and Drain Hose

- 6 - O-RINGS
- 7 - DRAIN VALVE
- 8 - FUEL HEATER THERMOSTAT
- 9 - WATER-IN-FUEL SENSOR

(5) **Fuel Filter Replacement:** The fuel filter is located inside of the fuel filter housing (Fig. 6).

(a) Unscrew and remove fuel filter cap at top of fuel filter housing (Fig. 5). To unscrew, attach tool to 6-sided hex center of cap. Do not attempt to loosen cap at outer edge. The fuel filter cap is designed to remove filter while pulling up on cap.

(b) Remove o-ring (Fig. 6) from filter cap and discard.

(c) The filter is retained to the cap with a series of locking fingers. Carefully pry back a few of the fingers to unlock filter from cap.

(6) **Water-In-Fuel (WIF) Sensor Replacement:** The WIF sensor is located on the side of the fuel filter housing (Fig. 6).

(a) Disconnect electrical connector at sensor (Fig. 7).

(b) Unscrew sensor from filter housing.

FUEL FILTER / WATER SEPARATOR (Continued)

**Fig. 7 Water-In-Fuel Sensor**

- 1 - WATER-IN-FUEL (WIF) SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - WIF SENSOR CONNECTOR

**Fig. 8 Fuel Filter/Water Separator Location**

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

(c) Check condition of o-ring.

(d) Inspect the 2 WIF sensor probes. Carefully clean contaminants from sensor probes with a cloth if necessary. Replace sensor if probes are covered with contaminants and will not clean up.

(7) **Fuel Heater Element Replacement:** The heater element is located in the fuel filter housing (Fig. 6).

(a) Remove fuel filter. See previous steps.

(b) Disconnect electrical connector from fuel temperature sensor housing at side of fuel filter housing (Fig. 8).

(c) Remove 2 temperature sensor housing mounting screws and carefully remove sensor housing from fuel filter housing.

(d) Pry round wiring connector from fuel filter housing and heater element. This connector passes through the fuel filter housing and is plugged directly into the heater element.

(e) Unlock heater element fingers and pry heater element from filter housing.

(8) **Drain Valve Replacement:** The drain valve is located on the side of the fuel filter housing (Fig. 6).

(a) Disconnect drain hose (Fig. 5) at bottom of drain valve.

(b) Remove 4 drain valve mounting screws.

(c) Remove drain valve from filter housing.

(d) Remove 2 drain valve o-rings from filter housing.

INSTALLATION

Refer to maintenance schedules in this manual for recommended fuel filter replacement intervals.

(1) Thoroughly clean inside of filter housing, filter cap and all related components.

(2) **Fuel Filter:**

(a) Fill fuel filter housing with clean diesel fuel.

If filter housing (canister) is not filled with clean diesel fuel before installation, manual air bleeding of fuel system may be necessary (temporary rough engine running may occur). If necessary, refer to Air Bleed Procedures.

(b) Snap new filter into locking fingers on cap. Hole in filter should face downward.

(c) Install new o-ring to cap.

(d) Apply a light film of clean diesel oil to cap o-ring seal.

(e) Load filter and cap into housing.

(f) Tighten cap to 25 ft. lbs. torque. Do not over-tighten cap.

(3) **Water-In-Fuel (WIF) Sensor:**

(a) Install new o-ring seal to WIF sensor.

(b) Apply a light film of clean diesel oil to o-ring seal.

(c) Install sensor into housing.

(d) Tighten sensor to 2-3 N·m (15-20 in. lbs.) torque.

FUEL FILTER / WATER SEPARATOR (Continued)

- (e) Connect electrical connector to WIF sensor.
- (f) Install fuel filter. Refer to previous steps.
- (4) **Fuel Heater Element:**
 - (a) Do not install fuel filter until heater element is installed.
 - (b) Position heater element into filter housing (fingers downward). Lock fingers into housing.
 - (c) Install new o-ring to electrical connector (where connector passes through filter housing). Apply a light film of clean diesel oil to o-ring seal. Press this connector into filter housing until it snaps into heater element.
 - (d) Install temperature sensor housing and 2 mounting screws to fuel filter housing.
 - (e) Connect electrical connector.
 - (f) Install fuel filter. Refer to previous steps.
- (5) **Drain Valve:**
 - (a) Install 2 new o-rings to valve and filter housing.
 - (b) Apply a light film of clean diesel oil to both seals.
 - (c) Position valve to filter housing.
 - (d) Install 4 mounting screws and tighten to 3–5 N·m (30–40 in. lbs.) torque.
 - (e) Connect drain hose to drain valve.
 - (f) Install fuel filter. Refer to previous steps.
- (6) Start engine and check for leaks.

**Fig. 9 Fuel Heater Location**

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

FUEL HEATER

DESCRIPTION

The fuel heater assembly is located on the side of the fuel filter housing (Fig. 9).

The heater/element assembly is equipped with a temperature sensor (thermostat) that senses fuel temperature. This sensor is attached to the fuel heater/element assembly.

OPERATION

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

When the temperature is below 45 ± 8 degrees F, the temperature sensor allows current to flow to the heater element warming the fuel. When the temperature is above 75 ± 8 degrees F, the sensor stops current flow to the heater element.

Battery voltage to operate the fuel heater element is supplied from the ignition switch and through the fuel heater relay. Also refer to Fuel Heater Relay. **The fuel heater element and fuel heater relay are not computer controlled.**

The heater element operates on 12 volts, 300 watts at 0 degrees F.

DIAGNOSIS AND TESTING - FUEL HEATER

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

NOTE: The fuel heater element, fuel heater relay and fuel heater temperature sensor are not controlled by the Powertrain Control Module (PCM).

A malfunctioning fuel heater can cause a wax build-up in the fuel filter/water separator. Wax build-up in the filter/separator can cause engine starting problems and prevent the engine from revving up. It can also cause blue or white fog-like exhaust. If the heater is not operating in cold temperatures, the engine may not operate due to fuel waxing.

The fuel heater assembly is located on the side of the fuel filter housing (Fig. 10).

The heater assembly is equipped with a built-in fuel temperature sensor (thermostat) that senses fuel temperature. When fuel temperature drops below 45 degrees \pm 8 degrees F, the sensor allows current to flow to the built-in heater element to warm the fuel. When fuel temperature rises above 75 degrees \pm 8 degrees F, the sensor stops current flow to the heater element (circuit is open).

FUEL HEATER (Continued)

**Fig. 10 Fuel Heater Location**

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

Voltage to operate the fuel heater element is supplied from the ignition switch, through the fuel heater relay (also refer to Fuel Heater Relay), to the fuel temperature sensor and on to the fuel heater element.

The heater element operates on 12 volts, 300 watts at 0 degrees F. As temperature increases, power requirements decrease.

A minimum of 7 volts is required to operate the fuel heater. The resistance value of the heater element is less than 1 ohm (cold) and up to 1000 ohms warm.

TESTING

(1) Disconnect electrical connector at sensor (Fig. 10).

Turn key to ON position. 12 volts should be present at red wire. If not, check fuel heater relay and related wiring. Refer to Relay Test—Fuel Heater. If OK, proceed.

Turn key OFF. Check black wire in connector for ground continuity with an ohmmeter. If continuity is not present, correct open ground circuit. This test can also be performed with a voltmeter by backprobing black wire with it connected to sensor. Reconnect electrical connector and turn key ON. Voltage drop should not exceed 2 volts (2 volts lower than checked at 12V+ connector). If voltage is lower, check for dirty

or corroded ground connection and repair. If OK, proceed.

(2) With electrical connector disconnected at sensor and key OFF, check electrical/mechanical operation of fuel temperature sensor. Proceed to next step:

(3) Using an ohmmeter, check for continuity across two terminals in electrical connector at side of sensor. Sensor circuit should be open if fuel temperature has risen above 75 degrees \pm 8 degrees F. Sensor circuit should be closed if fuel temperature has dropped below 45 degrees \pm 8 degrees F. If not, replace fuel heater assembly. This same test can also be performed using a voltmeter, with key ON, and by back-probing connector.

REMOVAL/INSTALLATION

The fuel heater/element/sensor assembly is located inside of the fuel filter housing. Refer to Fuel Filter/Water Separator Removal/Installation for procedures.

FUEL HEATER RELAY**DESCRIPTION**

The fuel heater relay is located in Power Distribution Center (PDC) (Fig. 11). Refer to label on inside of PDC cover for relay location.

**Fig. 11 Power Distribution Center Location**

- 1 - CLIP
- 2 - BATTERY
- 3 - TRAY
- 4 - NEGATIVE CABLE
- 5 - POSITIVE CABLE
- 6 - CLIP
- 7 - FENDER INNER SHIELD
- 8 - POWER DISTRIBUTION CENTER

OPERATION

Battery voltage to operate the fuel heater element is supplied from the ignition switch through the fuel heater relay. **The fuel heater element and fuel heater relay are not computer controlled.**

FUEL HEATER RELAY (Continued)

DIAGNOSIS AND TESTING - FUEL HEATER RELAY

The fuel heater relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

To test the fuel heater, refer to Fuel Heater Test.

To test the heater relay only, refer to following:

The relay terminal numbers from (Fig. 12) can be found on the bottom of the relay.

- Terminal number 30 is connected to battery voltage and can be switched or B+ (hot) at all times.
- The center terminal number 87A is connected (a circuit is formed) to terminal 30 in the de-energized (normally OFF) position.
- Terminal number 87 is connected (a circuit is formed) to terminal 30 in the energized (ON) position. Terminal number 87 then supplies battery voltage to the component being operated.
- Terminal number 86 is connected to a switched (+) power source.
- Terminal number 85 is grounded by the powertrain control module (PCM).

TESTING

- (1) Remove relay before testing.
- (2) Using an ohmmeter, perform a resistance test between terminals 85 and 86. Resistance value (ohms) should be 75 ± 5 ohms for resistor equipped relays.
- (3) Connect the ohmmeter between terminals number 87A and 30. Continuity should be present at this time.
- (4) Connect the ohmmeter between terminals number 87 and 30. Continuity should not be present at this time.
- (5) Use a set of jumper wires (16 gauge or smaller). Connect one jumper wire between terminal number 85 (on the relay) to the ground side (-) of a 12 Volt power source.
- (6) Attach the other jumper wire to the positive side (+) of a 12V power source. Do not connect this jumper wire to relay at this time.

Fig. 12 Relay Terminals

FUEL HEATER RELAY (Continued)

CAUTION: Do not allow the ohmmeter to contact terminals 85 or 86 during these tests. Damage to ohmmeter may result.

(7) Attach the other jumper wire (12V +) to terminal number 86. This will activate the relay. Continuity should now be present between terminals number 87 and 30. Continuity should not be present between terminals number 87A and 30.

(8) Disconnect jumper wires from relay and 12 Volt power source.

(9) If continuity or resistance tests did not pass, replace relay. If tests passed, refer to 8, Wiring Diagrams for (fuel system) relay wiring schematics and for additional circuit information.

REMOVAL

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 13). Refer to label under PDC cover for relay location.

Fig. 13 Power Distribution Center (PDC) Location

- 1 - CLIP
- 2 - BATTERY
- 3 - TRAY
- 4 - NEGATIVE CABLE
- 5 - POSITIVE CABLE
- 6 - CLIP
- 7 - FENDER INNER SHIELD
- 8 - POWER DISTRIBUTION CENTER

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 13). Refer to label under PDC cover for relay location.

- (1) Install relay to PDC.
- (2) Install cover to PDC.

FUEL INJECTION PUMP

DESCRIPTION—FUEL PUMP 245 H.P.

Although the fuel injection pump on the 245 horsepower engine appears similar to other VP 44 injection pumps, there are internal differences that make it unique. If pump replacement is necessary, be sure to verify pump number. The pump number can be found on the Fuel Injection Pump Data Plate (Fig. 14).

- A. ORDER NUMBER
- B. BOSCH PART NUMBER
- C. FACTORY CODE
- D. CUMMINS PART NUMBER
- E. MANUFACTURE DATE
- F. PUMP SERIAL NUMBER
- G. LAST THREE DIGITS OF KEY PART NUMBER

80b4b8c9

Fig. 14 Fuel Injection Pump Data Plate Location

- 1 - PUMP DATA PLATE

FUEL INJECTION PUMP (Continued)

DESCRIPTION—FUEL PUMP 235 H.P.

The fuel injection pump is mounted to the rear of the timing gear housing on the left side of engine (Fig. 15).

Fig. 15 Fuel Injection Pump Location

- 1 - FPCM ELECTRICAL CONNECTOR
- 2 - HIGH-PRESSURE FUEL LINES
- 3 - FITTINGS
- 4 - FUEL INJECTION PUMP
- 5 - FPCM

OPERATION

The Bosch VP44 fuel injection pump (Fig. 16) is a solenoid-valve controlled-radial-piston-distributor type pump.

The injection pump is driven by the engine camshaft. A gear on the end of the pump shaft meshes with the camshaft gear. The pump is timed to the engine. The VP44 is controlled by an integral (and non-serviceable) Fuel Pump Control Module (FPCM) (Fig. 15). The FPCM can operate the engine as an engine controller if a Crankshaft Position Sensor (CKP) signal is not present.

Fuel from the transfer (lift) pump enters the VP44 where it is pressurized and then distributed through high-pressure lines to the fuel injectors. The VP44 is cooled by the fuel that flows through it. A greater quantity of fuel is required for cooling the VP44 than what is necessary for engine operation. Because of this, approximately 70 percent of fuel entering the pump is returned to the fuel tank through the overflow valve and fuel return line. Refer to Overflow Valve Description/Operation for additional information.

Fig. 16 Bosch VP44 Fuel Injection Pump

1 - BOSCH VP44 PUMP

The VP44 is not self-priming. At least two fuel injectors must be bled to remove air from the system. When servicing the fuel system, disconnecting components up to the pump will usually not require air bleeding from the fuel system. However, removal of the high-pressure lines, removal of the VP44 pump, or allowing the vehicle to completely run out of fuel, will require bleeding air from the high-pressure lines at the fuel injectors.

VP44 timing is matched to engine timing by an off-set keyway that fits into the pump shaft. This keyway has a stamped number on it that is matched to a number on the VP44 pump (each keyway is calibrated to each pump).

When removing/installing the VP44, the same numbered keyway must always be installed. Also, the arrow on the top of the keyway should be installed pointed rearward towards the pump.

Because of electrical control, the injection pump high and low idle speeds are not adjustable. Also, adjustment of fuel pump timing is not required and is not necessary.

DIAGNOSIS AND TESTING—FUEL INJECTION PUMP TIMING

With the Bosch VP44 injection pump, there are no mechanical adjustments needed for fuel injection timing. All timing and fuel adjustments are made by the Engine Control Module (ECM). However, if a Diagnostic Trouble Code (DTC) has been stored indicating an "engine sync error" or a "static timing error", perform the following.

FUEL INJECTION PUMP (Continued)

Note: If this DTC appears after installation of a new or rebuilt injection pump, the pump keyway has probably been installed backwards. Refer to Fuel Injection Pump Removal/Installation for keyway information.

Fig. 21 Checking Fuel Injection Pump Gear Timing

- 1 - PUMP SHAFT
- 2 - KEYWAY
- 3 - PUMP GEAR
- 4 - CAM GEAR
- 5 - CRANKSHAFT GEAR

(1) Remove hose clamp and crankcase vent hose at crankcase breather (Fig. 17). Remove crankcase breather from gear cover. Breather threads into cover.

(2) Remove injection pump nut and washer (Fig. 18). Locate keyway behind washer.

(3) Be sure keyway aligning fuel injection pump shaft to injection pump gear is in proper position and pump gear has not slipped on pump shaft.

The following steps will require removing timing gear cover to gain access to timing gears. Refer to Group 9, Engines for procedures.

(4) Use a T-type puller to separate injection pump gear from pump shaft.

(5) Be sure keyway has been installed with arrow pointed to **rear** of pump (Fig. 19).

(6) **Pump timing has been calibrated to pump keyway. Be sure 3-digit number on pump keyway (Fig. 19) matches 3-digit number on fuel injection pump data plate. Plate is located on side of injection pump (Fig. 20). Twenty-one different calibrated keyways/pumps are available.**

(7) Verify timing marks on crank, cam and pump are aligned (Fig. 21).

(8) Perform necessary gear alignment/repairs as needed.

(9) Install crankcase breather to gear cover. Install hose clamp and crankcase vent hose to breather (Fig. 17).

(10) After repairs are completed, erase DTC using DRB Scan Tool.

REMOVAL

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables at both batteries. Cover and isolate ends of cables.

(2) Thoroughly clean fuel lines at cylinder head and injection pump ends. Thoroughly clean fuel injection pump and supply/return lines at side of pump.

(3) Disconnect 9-way electrical connector at Fuel Pump Control Module (FPCM) (Fig. 22).

80bfe0d0

Fig. 22 FPCM 9-Way Connector

- 1 - FPCM ELECTRICAL CONNECTOR
- 2 - HIGH-PRESSURE FUEL LINES
- 3 - FITTINGS
- 4 - FUEL INJECTION PUMP
- 5 - FPCM

(4) Remove fuel return line at side of injection pump by removing overflow valve (Fig. 23). Place rag beneath overflow valve to catch excess fuel.

(5) Remove fuel supply line at side of injection pump by removing banjo bolt (Fig. 23). Also remove same line at top of fuel filter housing (banjo bolt).

(6) Remove all high-pressure fuel lines, intake air tube, accelerator pedal position sensor, air intake housing, engine oil dipstick tube, wiring clips, electrical cables at intake heaters and engine lifting bracket. Refer to High-Pressure Fuel Line Removal/Installation. All of these items are covered in this procedure.

(7) Remove hose clamp at crankcase vent hose (Fig. 24) and remove hose from canister.

(8) Remove (unscrew) canister (Fig. 24) from gear cover.

FUEL INJECTION PUMP (Continued)

- 3 - 3-DIGIT KEYWAY NUMBER
- 4 - O-RING

(13) Use T-bar type puller (Fig. 28) to separate injection pump gear from injection pump shaft. Attach two M8 X 1.24 MM (metric) screws through puller and into two threaded holes supplied in pump gear. Pull injection pump gear forward until it loosens from injection pump shaft. **Pull on gear only enough to loosen it from injection pump shaft. Pulling gear too far may cause damage or breakage to gear cover.**

(14) Remove 2 rear/lower pump bracket bolts (Fig. 29).

(15) Remove 4 injection pump-to-gear housing mounting nuts (Fig. 30).

(16) Remove injection pump from gear housing. **Take care not to nick injection pump shaft on aluminum gear housing when removing pump. Also be very careful not to drop pump keyway (Fig. 32) into gear housing.**

CAUTION: Whenever the fuel injection pump is removed from the engine, the pump drive gear is laying loose on the camshaft drive gear. Never attempt to crank or rotate the engine with the pump removed from the engine. Serious damage will occur.

INSTALLATION

(1) Inspect pump mounting surfaces at pump and mounting flange for nicks, cuts or damage. Inspect o-ring surfaces for nicks, cuts or damage.

(2) Clean injection pump mounting flange (Fig. 31) at gear housing. Also clean front of injection pump.

(3) Install new rubber o-ring (Fig. 33) at pump mounting area.

80b4b8c5

Fig. 33 Keyway, Keyway Arrow and Keyway Number

- 1 - INJECTION PUMP
- 2 - DIRECTIONAL ARROW
- 3 - 3-DIGIT KEYWAY NUMBER
- 4 - O-RING

(4) Apply clean engine oil to injection pump o-ring only.

The machined tapers on both injection pump shaft and injection pump gear (Fig. 34) must be absolutely dry, clean and free of any dirt or oil film. This will ensure proper gear-to-shaft tightening.

FUEL INJECTION PUMP (Continued)

80b4b8c4

Fig. 34 Injection Pump Installation

- 1 - DOWEL
- 2 - PUMP
- 3 - PUMP SHAFT TAPER
- 4 - INJECTION PUMP GEAR TAPER

(5) Clean pump gear and pump shaft at machined tapers (Fig. 34) with an evaporative type cleaner such as brake cleaner.

Keyway Installation:

(6) The pump/gear keyway has an arrow and a 3-digit number stamped at top edge (Fig. 33). Position keyway into pump shaft with **arrow pointed to rear of pump**. Also be sure 3-digit number stamped to top of keyway is same as 3-digit number stamped to injection pump data plate (Fig. 35). If wrong keyway is installed, a diagnostic trouble code may be set.

(7) Position pump assembly to mounting flange on gear cover while aligning injection pump shaft through back of injection pump gear. When installing pump, dowel (Fig. 34) on mounting flange must align to hole in front of pump.

(8) After pump is positioned flat to mounting flange, install four pump mounting nuts and tighten finger tight only. Do not attempt a final tightening at this time. **Do not attempt to tighten (pull) pump to gear cover using mounting nuts. Damage to pump or gear cover may occur. The pump must be positioned flat to its mounting flange before attempting to tighten mounting nuts.**

(9) To prevent damage or cracking of components, tighten nuts/bolts in the following sequence:

- (a) Install injection pump shaft washer and nut to pump shaft. Tighten nut **finger tight only**.
- (b) Install 2 rear/lower pump mounting bolts **finger tight only**.

- A. ORDER NUMBER
- B. BOSCH PART NUMBER
- C. FACTORY CODE
- D. CUMMINS PART NUMBER
- E. MANUFACTURE DATE
- F. PUMP SERIAL NUMBER
- G. LAST THREE DIGITS OF KEY PART NUMBER

80b4b8c9

Fig. 35 Injection Pump Data Plate Location

- 1 - PUMP DATA PLATE

(c) Do preliminary tightening of injection pump shaft nut to 30 N·m (15–22 ft. lbs.) torque. **This is not the final torque.**

(d) Tighten 4 pump mounting nuts to 43 N·m (32 ft. lbs.) torque.

(e) Tighten 2 rear/lower pump bracket-to-pump bolts 24 N·m (18 ft. lbs.) torque.

(f) Do final tightening of injection pump shaft nut to 170 N·m (125 ft. lbs.) torque. Use barring tool to prevent engine from rotating when tightening gear.

(10) Install canister (Fig. 24) to gear cover.

(11) Install crankcase vent hose (Fig. 24) to canister and install hose clamp.

(12) Using new gaskets, install fuel return line and overflow valve to side of injection pump (Fig. 23). Tighten overflow valve to 24 N·m (18 ft. lbs.) torque.

(13) Using new gaskets, install fuel supply line to side of injection pump and top of fuel filter housing (Fig. 23). Tighten banjo bolts to 24 N·m (18 ft. lbs.) torque.

(14) Install all high-pressure fuel lines, intake air tube, accelerator pedal position sensor, air intake housing, engine oil dipstick tube, wiring clips, electrical cables at intake heaters and engine lifting bracket. Refer to High-Pressure Fuel Line Removal/Installation. All of these items are covered in this procedure.

FUEL INJECTION PUMP (Continued)

(15) Connect 9-way electrical connector to Fuel Pump Control Module (FPCM) (Fig. 22).

(16) Connect both negative battery cables to both batteries.

(17) Bleed air from fuel system.(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(18) Check system for fuel or engine oil leaks.

FUEL INJECTION PUMP DATA PLATE

SPECIFICATIONS

FUEL INJECTION PUMP DATA PLATE

Pertinent information about the fuel injection pump is machined into a boss on the drivers side of the fuel injection pump (Fig. 36).

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel tank module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel tank module on diesel powered models has 3 different circuits (wires). Two of these circuits are used at the fuel gauge sending unit for fuel gauge operation. The other wire is used for a ground. The diesel engine does not have a fuel tank module mounted electric fuel pump. The electric fuel pump (fuel transfer pump) is mounted to the engine.

For Fuel Gauge Operation: A constant input voltage source of about 12 volts (battery voltage) is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel tank module electrical connector unplugged). With the connectors plugged, output voltages will vary from about .6 volts at FULL, to about 7.0 volts at EMPTY.** The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

FUEL LINES

DESCRIPTION

All fuel lines up to the fuel injection pump are considered low-pressure. This includes the fuel lines from: the fuel tank to the fuel transfer pump, and the fuel transfer pump to the fuel injection pump. The fuel return lines, the fuel drain manifold and the fuel drain manifold lines are also considered low-pressure lines. High-pressure lines are used between

FUEL LINES (Continued)

the fuel injection pump and the fuel injectors. Also refer to High-Pressure Fuel Lines Description/Operation.

DESCRIPTION—HIGH PRESSURE FUEL LINES

The high-pressure fuel lines are the 6 lines located between the fuel injection pump and the fuel injector connector tubes (Fig. 37). All other fuel lines are considered low-pressure lines.

Fig. 37 High-Pressure Fuel Lines

OPERATION—HIGH PRESSURE FUEL LINES

CAUTION: The high-pressure fuel lines must be held securely in place in their holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel under pressure of up to approximately 120,000 kPa (17,405 PSI) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION

PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING - HIGH-PRESSURE FUEL LINE LEAKS

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES OF UP TO 120,000 kPa (17,400 PSI), USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Start the engine. Move the cardboard over the high-pressure fuel lines and check for fuel spray onto the cardboard (Fig. 38). If a high-pressure line connection is leaking, bleed the system and tighten the connection. Refer to the Air Bleed Procedure in this group for procedures. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

Fig. 38 Typical Test for Leaks with Cardboard

- 1 - HIGH-PRESSURE LINE
- 2 - CARDBOARD
- 3 - FITTING

FUEL LINES (Continued)

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

High-pressure lines are used between the fuel injection pump and the fuel injectors only. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

(2) Thoroughly clean fuel lines at cylinder head and injection pump ends.

(3) Remove cable cover (Fig. 39). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 39). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal. **Do not remove any cables at lever.**

- 4 - APPS CONNECTOR

(7) Disconnect 2 electrical cables from cable mounting studs (Fig. 43) at intake air heater on top of intake manifold.

(8) Remove engine oil dipstick from engine.

(9) Remove engine oil dipstick tube support mounting bolt (Fig. 43) and position tube to side.

(10) Disconnect clamps and remove air tube (intake manifold-to-intercooler) (Fig. 41).

(11) Remove 4 air intake housing mounting bolts and remove housing (Fig. 44) and (Fig. 43). Position ground cable at top of air intake housing to front of engine.

(12) Remove intake manifold air heater element block from engine (Fig. 45). Discard old upper and lower gaskets

(13) Remove 3 cable bracket housing mounting bolts (Fig. 44). Carefully position cable bracket and cable assembly to side of engine. **Leave cables connected to lever.**

(14) Remove engine lifting bracket at rear of intake manifold (2 bolts) (Fig. 46).

(15) Remove bolts from all fuel injection line support brackets at intake manifold.

(16) Place shop towels around fuel lines at fuel injectors. Do not allow fuel to drip down side of engine.

- 2 - HIGH-PRESSURE FUEL LINES
- 3 - FITTINGS
- 4 - FUEL INJECTION PUMP
- 5 - FPCM

(19) Carefully remove front line bundle from engine. **Do not bend lines while removing.** While removing front line bundle, note line position.

(20) Loosen high-pressure lines at injection pump beginning with cylinders 3, 5 and 6.

(21) Loosen high-pressure lines at cylinder head for cylinders 3, 5 and 6 (Fig. 46).

(22) Carefully remove rear line bundle from engine. **Do not bend lines while removing.** While removing rear line bundle, note line position.

INSTALLATION

High-pressure lines are used between the fuel injection pump and the fuel injectors only. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: Be sure that the high-pressure fuel lines are installed in the same order that they were removed.

(1) Lubricate threads of injector line fittings with clean engine oil.

(2) Loosen, but do not remove, all fuel line support bracket bolts.

FUEL LINES (Continued)

(3) Install **rear** injection line bundle beginning with cylinder head (fuel injector) connections, followed by injection pump connections. Tighten all fittings finger tight.

(4) Tighten fittings at fuel injector ends for cylinders number 6 and 5 to 38 N·m (28 ft. lbs.) torque. **Do not tighten number 3 line at this time. It will be tightened during bleeding procedure.**

(5) Tighten 3 fittings at fuel injection pump ends to 24 N·m (18 ft. lbs.) torque.

(6) Install **front** injection line bundle beginning with cylinder head (fuel injector) connections, followed by injection pump connections. Tighten all fittings finger tight.

(7) Tighten fitting at fuel injector end for cylinder number 2 to 38 N·m (28 ft. lbs.) torque. **Do not tighten lines number 1 or 4 at this time. They will be tightened during bleeding procedure.**

(8) Tighten remaining 3 fittings at fuel injection pump ends to 24 N·m (18 ft. lbs.) torque.

(9) Install fuel line support bracket bolts to intake manifold and tighten to 24 N·m (18 ft. lbs.) torque.

CAUTION: Be sure fuel lines are not contacting each other or any other component. Noise will result.

(10) Install engine lifting bracket at rear of intake manifold. Tighten 2 bolts to 77 N·m (57 ft. lbs.) torque.

(11) Install cable bracket housing/cable assembly and tighten 3 mounting bolts to 24 N·m (18 ft. lbs.) torque.

(12) Clean any old gasket material below and above intake manifold air heater element block. Also clean mating areas at intake manifold and air intake housing.

(13) Using new gaskets, position intake manifold air heater element block to engine.

(14) Install air intake housing and position ground cable. Install 4 mounting bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(15) Install air tube (intake manifold-to-charge air cooler) (Fig. 41). Tighten clamps to 8 N·m (72 in. lbs.) torque.

(16) Install engine oil dipstick tube support mounting bolt and tighten to 24 N·m (18 ft. lbs.) torque.

(17) Install engine oil dipstick to engine.

(18) Connect 2 electrical cables to cable mounting studs.

(19) Connect electrical connector to bottom of APPS by pushing connector upward until it snaps into position.

(20) Connect wiring harness (clip) at bottom of Accelerator Pedal Position Sensor (APPS) mounting bracket (Fig. 40).

(21) Connect front wiring clip (Fig. 41) to cable bracket housing.

(22) Install cable cover (Fig. 39).

(23) Connect both negative battery cables to both batteries.

(24) Bleed air from fuel system. Do this at fuel injector ends of lines. Use cylinders numbers 1, 3 and 4 for bleeding. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). After bleeding, tighten fittings to 38 N·m (28 ft. lbs.) torque.

(25) Check lines/fittings for leaks.

FUEL TANK

DESCRIPTION - DIESEL FUEL TANK

The fuel tank is similar to the tank used with gasoline powered models. The tank is equipped with a separate fuel return line and a different fuel tank module for diesel powered models. A fuel tank mounted, electric fuel pump is not used with diesel powered models. Refer to Fuel Tank Module for additional information.

For removal and installation procedures, refer to Fuel Tank - Gasoline Engines.

FUEL TANK MODULE

DESCRIPTION

An electric fuel pump is **not used** in the fuel tank module for diesel powered engines. Fuel is supplied by the engine mounted fuel transfer pump and the fuel injection pump.

The fuel tank module is installed in the top of the fuel tank (Fig. 48). The fuel tank module (Fig. 48) contains the following components:

- Fuel reservoir
- A separate in-tank fuel filter
- Rollover valve
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection
- Fuel return line connection
- Auxiliary non-pressurized fuel supply fitting

OPERATION

Refer to Fuel Gauge Sending Unit.

REMOVAL

(1) Drain and remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Thoroughly clean area around tank module at top of tank.

FUEL TANK MODULE (Continued)

80b0d721

Fig. 48 Top View of Fuel Tank Module—Diesel

- 5 - LOCKNUT
- 6 - ROLLOVER VALVE

(3) The plastic fuel tank module locknut is threaded onto fuel tank (Fig. 39). Install Special Tool 6856 to locknut and remove locknut (Fig. 49). The fuel tank module will spring up when locknut is removed.

(4) Remove module from fuel tank.

8020cd9e

Fig. 49 Locknut Removal/Installation—TYPICAL MODULE

- 1 - SPECIAL TOOL 6856
- 2 - LOCKNUT

INSTALLATION

CAUTION: Whenever the fuel tank module is serviced, the rubber gasket must be replaced.

(1) Thoroughly clean locknut and locknut threads at top of tank.

(2) Using new gasket, carefully position fuel tank module into opening in fuel tank.

(3) Position locknut over top of fuel tank module. Install locknut finger tight.

(4) When looking down at tank from drivers side of tank, the arrow at top of module should be aligned between two marks stamped into tank (approximately 2 o'clock position). The fuel line connectors, roll over valve and fuel gauge electrical connector should all be pointed to drivers side of vehicle. Rotate and align module/tank marks if necessary before tightening locknut. **This step must be performed to prevent the module's float from contacting side of fuel tank.**

(5) Tighten locknut to 24–44 N·m (18–32 ft. lbs.) torque.

(6) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL TRANSFER PUMP

DESCRIPTION

The fuel transfer pump (fuel lift pump) is located on the left-rear side of the engine cylinder block above the starter motor (Fig. 50). The 12-volt electric vane-type pump is operated and controlled by the Engine Control Module (ECM) (Fig. 51).

OPERATION

The purpose of the fuel transfer pump is to supply (transfer) a low-pressure fuel source: **from** the fuel tank, **through** the fuel filter/water separator and **to** the fuel injection pump. Here, the low-pressure is raised to a high-pressure by the fuel injection pump for operation of the high-pressure fuel injectors. Check valves within the pump, control direction of fuel flow and prevent fuel bleed-back during engine shut down.

Normal current flow to the pump is 12 amperes.

With the engine running, the pump has 2 modes of operation: Mode 1: 100 percent duty-cycle with a minimum pressure of 10 psi **except when the engine is cranking**. Mode 2: 25 percent duty-cycle with minimum pressure of 7 psi **with the engine cranking**.

The 25 percent duty-cycle is used to limit injection pump inlet pressure until the engine is running.

FUEL TRANSFER PUMP (Continued)

**Fig. 50 Fuel Transfer Pump Location**

- 1 - OIL PRESSURE SENSOR
- 2 - PUMP BRACKET NUTS (3)
- 3 - SUPPORT BRACKET BOLT
- 4 - BANJO BOLT (REAR)
- 5 - FUEL SUPPLY LINE
- 6 - ELECTRICAL CONNECTOR
- 7 - BANJO BOLT (FRONT)
- 8 - FUEL TRANSFER PUMP

The transfer pump is self-priming: When the key is first turned on (without cranking engine), the pump will operate for approximately 2 seconds and then shut off. The pump will also operate for up to 25 seconds after the starter is engaged, and then disengaged and the engine is not running. The pump shuts off immediately if the key is on and the engine stops running.

The fuel volume of the transfer pump will always provide more fuel than the fuel injection pump requires. Excess fuel is returned from the injection pump through an overflow valve. The valve is located on the side of the injection pump (Fig. 52). It is also used to connect the fuel return line to the side of the injection pump. This valve opens at approximately 97 kPa (14 psi) and returns fuel to the fuel tank through the fuel return line.

DIAGNOSIS AND TESTING - FUEL TRANSFER PUMP PRESSURE

The following tests will include: pressures tests of fuel transfer pump (engine running and engine cranking), a pressure drop test of fuel filter, a test for supply side restrictions, and a test for air in fuel supply side.

**Fig. 51 Engine Control Module (ECM) Location**

- 1 - ENGINE CONTROL MODULE (ECM)

- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

FUEL TRANSFER PUMP (Continued)

Refer to Fuel Transfer Pump Description/Operation for an operational description of transfer pump.

The fuel transfer (lift) pump is located on left side of engine and above starter motor (Fig. 53).

Fig. 53 Fuel Transfer Pump Location

- 1 - OIL PRESSURE SENSOR
- 2 - PUMP BRACKET NUTS (3)
- 3 - SUPPORT BRACKET BOLT
- 4 - BANJO BOLT (REAR)
- 5 - FUEL SUPPLY LINE
- 6 - ELECTRICAL CONNECTOR
- 7 - BANJO BOLT (FRONT)
- 8 - FUEL TRANSFER PUMP

An improperly operating fuel transfer pump, a plugged or dirty fuel filter, or a defective overflow valve can cause low engine power, excessive white smoke and/or hard engine starting.

Before performing following tests, inspect fuel supply and return lines for restrictions, kinks or leaks.

Fuel leaking from pump casing indicates a leaking pump which must be replaced.

Pressure Test: Because the transfer pump is operating at two different pressure cycles (engine running and engine cranking), two different pressure tests will be performed.

(1) Remove protective cap at inlet test port (Fig. 54). Clean area around cap/fitting before cap removal.

(2) Remove protective cap at outlet test port (Fig. 55). Clean area around cap/fitting before cap removal.

(3) Install Special Fuel Pressure Test Gauge 6828 (or equivalent) to fitting at inlet test port (Fig. 54).

Fig. 54 Fuel Pressure Test Port Fitting (Inlet)

- 1 - FUEL PRESSURE TEST PORT (INLET)
- 2 - FUEL FILTER/WATER SEPARATOR

Fig. 55 Fuel Pressure Test Port Fitting (Outlet)

- 1 - FUEL PRESSURE TEST PORT (OUTLET)

(4) To prevent engine from starting, remove fuel system relay (fuel injection pump relay). Relay is located in Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

FUEL TRANSFER PUMP (Continued)

Fig. 56 Fuel Return and Supply Line Quick-Connect Locations

- 1 - FUEL RETURN LINE
- 2 - QUICK-CONNECT FITTINGS
- 3 - FUEL SUPPLY LINE

(5) Using key, crank engine over while observing gauge. Pressure should be 5–7 psi.

(6) Re-install fuel system relay to PDC.

(7) Start engine and record fuel pressure. Pressure should be a **minimum** of 69 kPa (10 psi) at idle speed.

(8) Because fuel pump relay was removed, a Diagnostic Trouble Code (DTC) may have been set. After testing is completed, and relay has been installed, use DRB scan tool to remove DTC.

Pressure Drop Test:

(9) Shut engine off and remove test gauge from inlet port test fitting. Re-attach 6828 test gauge to outlet port (Fig. 55). Start engine and record fuel pressure. Pressure should not be more than 34 kPa (5 psi) lower than inlet port pressure test. If so, replace fuel filter.

Fuel Supply Restriction Test:

Due to very small vacuum specifications, the DRB scan tool along with the Peripheral Expansion Port (PEP) Module and 0–15 psi transducer must be used.

(10) Verify transfer pump pressure is OK before performing restriction test.

(11) Locate and disconnect fuel supply line quick-connect fitting at left-rear of engine (Fig. 56). After disconnecting line, plastic clip will remain attached to metal fuel line at engine. Carefully remove clip from metal line. Snap same clip into fuel supply hose.

(12) Install Special Rubber Adapter Hose Tool 6631 (3/8") into ends of disconnected fuel supply line.

(13) Install transducer from PEP module to brass "T" fitting on tool 6631.

(14) Hook up DRB scan tool to transducer.

WARNING: DO NOT STAND IN LINE WITH THE COOLING FAN FOR THE FOLLOWING STEPS.

(15) Start engine and record vacuum reading with engine speed at high-idle (high-idle means engine speed is at 100 percent throttle and no load). The fuel restriction test **MUST** be done with engine speed at high-idle.

(16) If vacuum reading is **less** than 6 in/hg. (0–152 mm hg.), test is OK. If vacuum reading is **higher** than 6 in/hg. (152 mm hg.), restriction exists in fuel supply line or in fuel tank module. Check fuel supply line for damage, dents or kinking. If OK, remove module and check module and lines for blockage. Also check fuel pump inlet filter at bottom of module for obstructions.

Testing For Air Leaks in Fuel Supply Side:

(17) A 3-foot section of 3/8" I.D. clear tubing is required for this test.

(18) Using a tire core valve removal tool, carefully remove core valve from inlet fitting test port.

(19) Attach and clamp the 3/8" clear hose to fitting nipple.

(20) Place other end of hose into a large clear container. Allow hose to loop as high as possible **above** test port.

(21) The fuel transfer pump can be put into a 25 second run (test) mode if key is quickly turned to crank position and released back to run position without starting engine.

To prevent engine from starting in this test, first remove fuel system relay (fuel injection pump relay). Relay is located in Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

Because fuel pump relay was removed, a Diagnostic Trouble Code (DTC) may have been set. After testing is completed, and relay has been installed, use DRB scan tool to remove DTC.

(22) Allow air to purge from empty hose before examining for air bubbles. Air bubbles should not be present.

(23) If bubbles are present, check for leaks in supply line to fuel tank.

(24) If supply line is not leaking, remove fuel tank module and remove filter at bottom of module (filter snaps to module). Check for leaks between supply nipple at top of module, and filter opening at bottom of module. Replace module if necessary.

(25) After performing test, install core back into test fitting. Before installing protective cap, be sure fitting is not leaking.

FUEL TRANSFER PUMP (Continued)

REMOVAL

The fuel transfer pump (fuel lift pump) is located on left side of engine, below and rearward of fuel filter (Fig. 57).

Fig. 57 Fuel Transfer Pump Location

- 1 - OIL PRESSURE SENSOR
- 2 - PUMP BRACKET NUTS (3)
- 3 - SUPPORT BRACKET
- 4 - BANJO BOLT (REAR)
- 5 - FUEL SUPPLY LINE
- 6 - ELECTRICAL CONNECTOR
- 7 - BANJO BOLT (FRONT)
- 8 - FUEL TRANSFER PUMP

(1) Disconnect both negative battery cables at both batteries.

(2) Thoroughly clean area around transfer pump and fuel lines of any contamination.

(3) Remove starter motor. Refer to Starter Removal/Installation in 8, Starting System for procedures.

(4) Place a drain pan below the pump.

(5) Disconnect fuel line quick-connect fitting at fuel supply line (Fig. 57) at rear of pump.

(6) Remove support bracket bolt at top of pump (Fig. 57).

(7) Remove front and rear banjo bolts at pump (Fig. 57).

(8) Disconnect electrical connector at side of pump (Fig. 57).

(9) Remove three pump bracket nuts (Fig. 57) and remove pump from vehicle.

INSTALLATION

The fuel transfer pump (fuel lift pump) is located on left side of engine, below and rearward of fuel filter (Fig. 57).

(1) Install new gaskets to fuel supply line/support bracket and banjo bolt at rear of pump. Install line and banjo bolt to pump. **Do not** tighten banjo bolt at this time.

(2) Install new gaskets to fuel line and banjo bolt at front of pump.

(3) Position 3 pump studs into pump mounting bracket and install 3 nuts. **Do not** tighten nuts at this time.

(4) Install support bracket bolt (Fig. 57). **Do not** tighten bolt at this time.

(5) Tighten 3 pump nuts to 12 N·m (9 ft. lbs.) torque.

(6) Tighten both banjo bolts to 24 N·m (18 ft. lbs.) torque.

(7) Tighten support bracket bolt 12 N·m (9 ft. lbs.) torque.

(8) Connect electrical connector to pump (Fig. 57).

(9) Connect fuel line quick-connect fitting to fuel supply line at rear of pump.

(10) Install starter motor. Refer to Starter Removal/Installation in 8, Starting for procedures.

(11) Connect both negative battery cables at both batteries.

(12) Bleed air at fuel supply line at side of fuel injection pump. Refer to the Air Bleed Procedure.

(13) Start engine and check for leaks.

OVERFLOW VALVE

DESCRIPTION

The overflow valve is located on the side of the injection pump (Fig. 58). It is also used to connect the fuel return line (banjo fitting) to the fuel injection pump.

OPERATION

Fuel volume from the fuel transfer (lift) pump will always provide more fuel than the fuel injection pump requires. The overflow valve (a check valve) is used to route excess fuel through the fuel return line and back to the fuel tank. Approximately 70% of supplied fuel is returned to the fuel tank. The valve opens at approximately 97 kPa (14 psi). If the check valve within the assembly is sticking open, fuel drainage of the injection pump could cause hard starting.

OVERFLOW VALVE (Continued)

**Fig. 58 Overflow Valve Location**

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

**Fig. 59 Overflow Valve Location**

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

If a Diagnostic Trouble Code (DTC) has been stored for “decreased engine performance due to high injection pump fuel temperature”, the overflow valve may be stuck in closed position.

DIAGNOSIS AND TESTING - OVERFLOW VALVE

Fuel volume from the fuel transfer (lift) pump will always provide more fuel than the fuel injection pump requires. The overflow valve (a check valve) is used to route excess fuel through the fuel return line and back to the fuel tank. Approximately 70% of supplied fuel is returned to the fuel tank. The valve is located on the side of the injection pump (Fig. 59). It is also used to connect the fuel return line (banjo fitting) to the fuel injection pump. The valve opens at approximately 97 kPa (14 psi). If the check valve within the assembly is sticking, low engine power or hard starting may result.

If a Diagnostic Trouble Code (DTC) has been stored for “decreased engine performance due to high injection pump fuel temperature”, the overflow valve may be stuck in closed position.

A rubber tipped blow gun with regulated air line pressure is needed for this test.

(1) Clean area around overflow valve and fuel return line at injection pump before removal.

- (2) Remove valve from pump and banjo fitting.
- (3) Discard old sealing gaskets.
- (4) Set regulated air pressure to approximately 97 kPa (14–16 psi).
- (5) Using blow gun, apply pressure to overflow valve inlet end (end that goes into injection pump).
- (6) Internal check valve should release, and air should pass through valve at 97 kPa (14–16 psi). If not, replace valve.
- (7) Reduce regulated air pressure to 10 psi and observe valve. Valve should stay shut. If not, replace valve.
- (8) Install new sealing gaskets to valve.
- (9) Install valve through banjo fitting and into pump.
- (10) Tighten to 30 N·m (24 ft. lbs.) torque.

REMOVAL

The overflow valve (pressure relief valve) is located at the outside of fuel injection pump (Fig. 60). It connects the fuel return line (banjo fitting) to the pump. The valve has no internal serviceable parts and must be replaced as an assembly. Two sealing gaskets are used. One gasket is located between pump and banjo fitting. The other is located between the banjo fitting and end of valve.

OVERFLOW VALVE (Continued)

**Fig. 60 Overflow Valve Location**

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

(1) Clean area around overflow valve and fuel return line at injection pump before removal.

(2) Remove valve from pump and banjo fitting.

(3) Discard old sealing gaskets.

INSTALLATION

The overflow valve (pressure relief valve) is located at the outside of fuel injection pump (Fig. 60). It connects the fuel return line (banjo fitting) to the pump. The valve has no internal serviceable parts and must be replaced as an assembly. Two sealing gaskets are used. One gasket is located between pump and banjo fitting. The other is located between the banjo fitting and end of valve.

- (1) Install new sealing gaskets to valve.
- (2) Install valve through banjo fitting and into pump.
- (3) Tighten to 30 N·m (24 ft. lbs.) torque.

WATER IN FUEL SENSOR**DESCRIPTION**

The WIF sensor is located on the side of the fuel filter/water separator canister (Fig. 61).

**Fig. 61 Water-in-Fuel Sensor Location**

- 1 - WATER-IN-FUEL (WIF) SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - WIF SENSOR CONNECTOR

OPERATION

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CCD bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input at the end of the intake manifold air heater post-heat cycle.

REMOVAL

The Water-In-Fuel (WIF) sensor is located at the side of fuel filter/water separator canister. Refer to Fuel Filter/Water Separator Removal/Installation for WIF sensor removal/installation procedures.

FUEL DRAIN MANIFOLD

DESCRIPTION

The fuel drain manifold is actually a rifled passage within the cylinder head (Fig. 62).

Fig. 62 Fuel Drain Manifold Passage

- 1 - REAR OF CYLINDER HEAD
- 2 - BANJO FITTING/BOLT
- 3 - FUEL RETURN TO TANK
- 4 - FUEL RETURN LINES
- 5 - FUEL RETURN LINE FROM PUMP OVERFLOW VALVE
- 6 - FUEL DRAIN MANIFOLD PASSAGE
- 7 - "T"

OPERATION

When the engine is running, and during injection, a small amount of fuel flows past the injector nozzle and is not injected into the combustion chamber. This fuel is used to lubricate the fuel injectors. Excess fuel drains into the fuel drain manifold (or passage). Fuel is drained from this passage into a line at the rear of the cylinder head (Fig. 62). After exiting the cylinder head, fuel is routed (returned) back to the fuel tank. A "T" is installed into the fuel return line (Fig. 62). This "T" is used to allow excess fuel from the injection pump to be returned into the fuel tank. A one-way check valve within the overflow valve prevents fuel (from the fuel drain manifold) from entering the fuel injection pump.

A **small** amount of fuel is returned from the fuel injectors, while a **large** amount (about 70% of supplied fuel) is returned from the fuel injection pump.

REMOVAL

The fuel drain manifold (line) connects a fuel return passage within the cylinder head to a "T" fitting on the fuel return line. It is located at the rear of the cylinder head.

(1) Disconnect both negative battery cables at both batteries.

(2) Remove starter motor. Refer to Group 8B for procedures.

(3) Disconnect fitting at "T" (Fig. 63).

Fig. 63 Fuel Return Line at Rear of Cylinder Head

- 1 - REAR OF CYLINDER HEAD
- 2 - BANJO FITTING/BOLT
- 3 - FUEL RETURN TO TANK
- 4 - FUEL RETURN LINES
- 5 - FUEL RETURN LINE FROM PUMP OVERFLOW VALVE
- 6 - FUEL DRAIN MANIFOLD PASSAGE
- 7 - "T"

(4) Remove banjo bolt at rear of cylinder head. Discard old sealing washers.

(5) Remove fuel line from vehicle.

(6) Clean connection at rear of cylinder head before line installation.

INSTALLATION

The fuel drain manifold (line) connects a fuel return passage within the cylinder head to a "T" fitting on the fuel return line. It is located at the rear of the cylinder head.

Servicing fuel return components will not require air bleeding.

(1) Using new sealing washers, assemble banjo bolt to fuel line.

(2) Position line to engine and loosely tighten fasteners.

(3) Tighten banjo bolt to 24 N·m (18 ft. lbs.) torque.

(4) Tighten fitting at "T" to 12 N·m (106 in. lbs.) torque.

(5) Install starter motor. Refer to 8, Starter for procedures.

(6) Connect both negative battery cables at both batteries.

FUEL INJECTION - DIESEL

DESCRIPTION - DIESEL FUEL INJECTION SYSTEM

The Engine Control Module (ECM) and Fuel Injection Pump Control Module (FPCM) are used primarily for fuel system control. The ECM is a separate replaceable component, while the FPCM is internal to the fuel injection pump and is a non-serviceable part. The ECM and FPCM are interconnected (wired together) for fuel injection control.

The Powertrain Control Module (PCM) is used to regulate or control the A/C, charging and speed control systems. It is also used to partially control certain electronic automatic transmission components. The PCM also has control over certain instrument panel components.

Refer to either Powertrain Control Module (PCM) or Engine Control Module (ECM) for additional information. Refer to (Fig. 1) for a partial list of fuel system components.

DIAGNOSIS AND TESTING - BOOST PRESSURE

Two pressure gauges attached at two different points are required for this test.

Fig. 2 Boost Pressure Test at Intake Manifold

- 1 - REAR OF INTAKE MANIFOLD
- 2 - 3/4" PIPE PLUG

Fig. 3 Boost Pressure Test at Turbocharger

- 1 - TURBOCHARGER
- 2 - 1/8" FITTING
- 3 - SIGNAL LINE
- 4 - WASTEGATE ACTUATOR
- 5 - CONTROL ROD
- 6 - OIL SUPPLY LINE

(1) Obtain two 6828 fuel pressure test gauges (equivalent gauges are OK). **Gauge Consistency Test:** Connect the gauges together to a common pressure source and verify pressure consistency of both gauges. Do this consistency test at approximately 206 kPa (30 psi). If pressures are different, they can still be used for test. Note and record differences in pressures before testing. Make adjustments as necessary.

(2) Remove 3/4" pipe plug fitting at rear of intake manifold (Fig. 2). Temporarily replace this fitting with fitting reducer to adapt to pressure gauge.

Note: This pipe plug is located to front of MAP sensor. Do not remove plug to rear of MAP sensor. This is a COOLANT passage plug.

(3) Loosen hose clamp and disconnect rubber signal line (Fig. 3) from 1/8" brass fitting at front of turbocharger.

(4) Remove 1/8" brass fitting (Fig. 3) from turbocharger. Temporarily replace this fitting with a 1/8" "T" fitting to adapt to pressure gauge.

(5) Reattach signal line to temporary "T".

(6) Attach first pressure gauge to intake manifold fitting.

(7) Attach second pressure gauge to "T" fitting at turbocharger.

Engine must be at rated RPM and full load for the test.

If gauge pressure differential is greater than 3 psi (6 in. Hg), check intercooler and associated piping for restrictions, plugging or damage.

Maximum pressure at intake manifold (rated rpm and load) is 36–37 in/hg \pm 3 in/hg (17.7–18.2 psi \pm 1.5 psi).

Wastegate should open at no higher than 38.7 in/hg (19 psi) at wide open throttle, full load. If wastegate is out of adjustment, a DTC may have been set. Refer to Wastegate Adjustment in Engines for adjustment procedures.

ACCELERATOR PEDAL POSITION SENSOR

DESCRIPTION

The APPS assembly is located at the top-left-front of the engine (Fig. 4). A plastic cover is used to cover the assembly. The actual sensor is located behind its mounting bracket (Fig. 5).

Fig. 4 APPS Assembly Location

- 1 - LEVER
- 2 - MOUNTING BOLTS (6)
- 3 - WIRE HARNESS CLIP
- 4 - CALIBRATION SCREWS (NO ADJUSTMENT)
- 5 - APPS ASSEMBLY

OPERATION

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the Engine Control Module (ECM) with a DC voltage signal proportional to the angle, or position of the accelerator pedal. In previous model years, this part was known as the Throttle Position Sensor (TPS).

Diesel engines used in previous model years used a mechanical cable between the accelerator pedal and the TPS lever. Linkage and bellcranks between the TPS cable lever and the fuel injection pump were also used. Although the cable has been retained with the APPS, the linkage and bellcranks between the cable lever and the fuel injection pump are no longer used.

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated and permanently positioned to its mounting bracket.

Fig. 5 APPS Sensor Location (Rear View)

- 1 - APPS
- 2 - TAB
- 3 - PUSH FOR REMOVAL
- 4 - APPS CONNECTOR

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 4) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

REMOVAL

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket. The APPS assembly is located at left-front of engine below plastic cable/lever/linkage cover (Fig. 6).

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 8) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

ACCELERATOR PEDAL POSITION SENSOR (Continued)

(1) Disconnect both negative battery cables at both batteries.

(2) Remove cable cover (Fig. 6). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 6). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(3) Using finger pressure only, disconnect end of speed control servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 7). **DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(4) Using two small screwdrivers, pry throttle cable connector socket from throttle lever ball (Fig. 7). **Be very careful not to bend throttle lever arm.**

(5) Disconnect transmission control cable at lever arm (if equipped). Refer to 21, Transmission.

(6) Squeeze pinch tabs on speed control cable (Fig. 7) and pull cable rearward to remove from cable mounting bracket.

(7) Squeeze pinch tabs on throttle cable (Fig. 7) and pull cable rearward to remove from cable mounting bracket.

(8) If equipped with an automatic transmission, refer to 21, Transmission for transmission control cable removal procedures.

(9) Disconnect wiring harness clip (Fig. 8) at bottom of bracket.

(10) Remove 6 mounting bolts (Fig. 8) and partially remove APPS assembly from engine. After assembly is partially removed, disconnect electrical connector from bottom of sensor by pushing on connector tab (Fig. 9).

(11) Remove APPS assembly from engine.

INSTALLATION

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket. The APPS assembly is located at left-front of engine below plastic cable/lever/linkage cover (Fig. 6).

(1) Snap electrical connector into bottom of sensor.

(2) Position APPS assembly to engine and install 6 bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.

(3) Connect wiring harness clip (Fig. 8) at bottom of bracket.

(4) If equipped with an automatic transmission, refer to Group 21, Transmission for transmission control cable installation procedures.

(5) Install speed control cable into mounting bracket. Be sure pinch tabs (Fig. 7) have secured cable.

(6) Install throttle cable into mounting bracket. Be sure pinch tabs (Fig. 7) have secured cable.

(7) Connect throttle cable at lever (snaps on).

(8) Connect speed control cable to lever by pushing cable connector rearward onto lever pin while holding lever forward.

(9) Install cable cover.

(10) Connect both negative battery cables to both batteries.

(11) **ECM Calibration:** Turn key to ON position. Without starting engine, slowly press throttle pedal to floor and then slowly release. This step must be done (one time) to ensure accelerator pedal position sensor calibration has been learned by ECM. If not done, possible DTC's may be set.

(12) Use DRB scan tool to erase any DTC's from ECM/PCM.

FUEL INJECTOR

DESCRIPTION

Six individual, high-pressure fuel injectors are used. The injectors are vertically mounted (Fig. 10) into a bored hole in the top of the cylinder head. This bored hole is located between the intake/exhaust valves.

80b46ce3

Fig. 10 Fuel Injector Location

- 1 - CLAMP
- 2 - FUEL INJECTOR
- 3 - BORED HOLE
- 4 - SHIM
- 5 - BOLTS

FUEL INJECTOR (Continued)

OPERATION

High-pressure fuel is supplied from the injection pump, through a high-pressure fuel line, through a steel connector and into the fuel injector. When fuel pressure rises to approximately 31,026 kPa (4,500 psi), the needle valve spring tension is overcome. The needle valve rises and fuel flows through the spray holes in the nozzle tip into the combustion chamber. The pressure required to lift the needle valve is the nozzle opening pressure. This is sometimes referred to as the "pop" pressure setting.

Each fuel injector is connected to each high-pressure fuel line with a steel connector (Fig. 11). This steel connector is positioned into the cylinder head and sealed with an o-ring. The connectors are sealed to the high-pressure fuel lines with fittings (Fig. 11). The ferrule (Fig. 11) on the end of the high-pressure fuel line pushes against the steel connector when the fuel line fitting is torqued into the cylinder head. This torquing force provides a sealing pressure between both the fuel line-to-connector and the fuel connector-to-fuel injector. **The fitting torque is very critical.** If the fitting is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If the fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside the cylinder head and will not be visible. The result will be a possible fuel injector miss-fire and low power.

80b46ce4

Fig. 11 Fuel Injector Connections

- 1 - CONNECTOR
- 2 - O-RING
- 3 - FERRULE
- 4 - FITTING
- 5 - FUEL LINE
- 6 - INJECTOR

The fuel injectors use hole type nozzles (Fig. 12). High-pressure flows into the side of the injector and causes the injector needle to lift and fuel to be injected. The clearances in the nozzle bore (Fig. 12) are extremely small and any sort of dirt or contaminants will cause the injector to stick. Because of this, it is very important to do a thorough cleaning of any lines before opening up any fuel system component.

FUEL INJECTOR (Continued)

Always cover or cap any open fuel connections before a fuel system repair is performed.

Each fuel injector connector tube contains an edge filter (Fig. 13) that breaks up small contaminants that enter the injector. The edge filter uses the injectors pulsating high-pressure to break up most particles so they are small enough to pass through the injector. **The edge filters are not a substitute for proper cleaning and covering of all fuel system components during repair.**

The bottom of each fuel injector is sealed to the cylinder head with a **1.5mm** thick copper shim (gasket) (Fig. 12). The correct thickness shim must always be re-installed after removing an injector.

Fuel pressure in the injector circuit decreases after injection. The injector needle valve is immediately closed by the needle valve spring and fuel flow into the combustion chamber is stopped. Exhaust gases are prevented from entering the injector nozzle by the needle valve.

DIAGNOSIS AND TESTING—FUEL INJECTOR TEST

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 14).

Fig. 14 Fuel Injector Connections

- 1 - CONNECTOR
- 2 - O-RING
- 3 - FERRULE
- 4 - FITTING
- 5 - FUEL LINE
- 6 - INJECTOR

A leaking fuel injector can cause fuel knock, poor performance, black smoke, poor fuel economy and rough engine idle. If fuel injector needle valve does not operate properly, engine may misfire and produce low power.

A leak in injection pump-to-injector high-pressure fuel line can cause many of same symptoms as malfunctioning injector. Inspect for leaks in high-pressure lines before checking for malfunctioning fuel injector.

WARNING: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF UP TO APPROXIMATELY 120,000 kPa (17,400 psi) TO EACH INDIVIDUAL INJECTOR THROUGH HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO EXHAUST MANIFOLD WHEN BLEEDING AIR FROM FUEL SYSTEM.

80b46b80

Fig. 15 Inspecting Injector Operation

1 - HIGH-PRESSURE FUEL LINE

(1) To determine which fuel injector is malfunctioning, run engine and isolate each cylinder using DRB scan tool. **The DRB scan tool lists the injector firing order in both cylinder numerical order (1-2-3-4-5-6), and actual firing order (1-5-3-6-2-4).**

(2) Note RPM drop for each cylinder. As an alternative, loosen high-pressure fuel line fitting at fuel injector connector tube (Fig. 15). Listen for a change in engine speed. After testing, tighten line fitting to 40 N·m (30 ft. lbs.) torque. If engine speed drops, injector was operating normally. If engine speed remains same, injector may be malfunctioning. Test all injectors in same manner one at a time.

FUEL INJECTOR (Continued)

**Fig. 16 Fuel**

- 1 - FUEL INJECTOR
- 2 - ADAPTOR TOOL 8301
- 3 - POP PRESSURE TESTER

**Fig. 17 Installing Injector to Adaptor Tool 8301**

- 1 - ADAPTOR TOOL 8301
- 2 - TIP
- 3 - FUEL INJECTOR
- 4 - INLET AT SIDE OF INJECTOR

(3) Once injector has been found to be malfunctioning, remove it from engine and test it. Refer to Fuel Injector Removal/Installation.

WARNING: FUEL INJECTOR TESTERS CAN DEVELOP EXTREMELY HIGH PRESSURES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PRO-

TECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN OPERATING INJECTOR TESTOR.

(4) After injector has been removed, obtain bench-mount fuel injector tester OTC® (SPX®) part number 4210 (Fig. 16) (or equivalent). Install Special Tool number 8301 (Fuel Injector Adapter) to 4210 tester. Install fuel injector into 8301 adapter. Be sure tip of adapter tool 8301 is aligned to inlet hole at side of injector (Fig. 17) before tightening tool. Tighten tool 8301 to injector. Position container below injector before testing.

(5) Refer to operating instructions supplied with pressure tester for procedures.

(a) Check opening pressure or "pop" pressure. Pressure should be approximately 31,026 kPa (310 bars) or (4500 psi \pm 250 psi). If fuel injector needle valve is opening (popping) too early or too late, replace injector.

(b) Perform a leak-down test on injector. Apply pressure with injector tester. The injector should not leak (drip) fuel with pressure at approximately 20 bars (291 psi) lower than pop pressure.

(c) Operate tester lever quickly several times to check injector spray pattern. Verify fuel is spraying from each injector nozzle hole. Injector should also spray evenly from each nozzle hole.

(d) Pay attention to size and shape of spray plumes. They should all be equal. If possible, compare spray pattern to that of a new fuel injector with same part number. Checking each plume for consistency is an excellent indicator of injector performance. Even if only one nozzle hole is plugged, significant performance problems could result.

(e) Look for burrs on injector inlet.

(f) Check nozzle holes for hole erosion or plugging.

(g) Inspect end of nozzle for burrs or rough machine marks.

(h) Look for cracks at nozzle end.

(i) Check nozzle color for signs of overheating. Overheating will cause nozzle to turn a dark yellow/tan or blue (depending on overheating temperature).

(j) Look at end of injector tube where it meets injector. A small, shiny band should be seen at this point. The band should have a consistent thickness. If not, injector could be leaking into fuel return.

(k) If any of these conditions occur, replace injector.

REMOVAL

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 18).

FUEL INJECTOR (Continued)

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

Each fuel injector is connected to each high-pressure fuel line with a steel connector tube (Fig. 19). This steel connector is positioned into cylinder head and sealed with an o-ring. The connectors are connected to high-pressure fuel lines with fittings (Fig. 19).

(2) If injector at #1 or #2 cylinder is being removed, intake manifold air heater assembly must be removed. Refer to Intake Manifold Air Heater Removal/Installation.

(3) If injector at #5 cylinder is being removed, remove engine lifting bracket (2 bolts).

(4) Thoroughly clean area around injector and injector high-pressure lines before removal.

(5) Remove necessary high-pressure fuel lines. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - REMOVAL). **Do not bend any high-pressure fuel line to gain access to fuel injector.** Cover or cap any open fuel connections.

(6) Remove valve cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(7) Thread Special Tool 8324 (Fuel Injector Connector Tube Remover) onto end of injector connector tube (Fig. 20).

(8) Pull injector connector tube from cylinder head. **The injector connector tube must be removed before attempting to remove fuel injector or serious damage to fuel injector and tube will result.**

(9) Remove and discard old o-ring (Fig. 19) from injector connector tube.

(10) Remove fuel injector hold down clamp bolt at front end of clamp (Fig. 18). **Do not loosen or remove special (2 shouldered) bolt at rear end of clamp.** Remove injector clamp by sliding it from shoulders on rear clamp bolt.

(11) Thread rod from Special Tool number 8318 (Fuel Injector Remover) into top of fuel injector (Fig. 21).

(12) Tighten nut on 8318 tool to pull (remove) fuel injector from cylinder head.

(13) Remove and discard old o-ring from fuel injector.

(14) Remove and discard copper sealing washer (shim) (Fig. 22) from bottom of injector. **If copper sealing washer has remained in cylinder head, it must be removed.**

80b4b8b2

Fig. 23 Measuring Injector Sealing Washer (Shim)

- 1 - SHIM

INSTALLATION

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 18).

- (1) Inspect fuel injector.
 - (a) If necessary, perform pressure test of injector. Refer to Fuel Injector Testing.
 - (b) Look for burrs on injector inlet.

(c) Check nozzle holes for hole erosion or plugging.

(d) Inspect end of nozzle for burrs or rough machine marks.

(e) Look for cracks at nozzle end.

(f) Check nozzle color for signs of overheating. Overheating will cause nozzle to turn a dark yellow/tan or blue (depending on overheating temperature).

FUEL INJECTOR (Continued)

(g) If any of these conditions occur, replace injector.

(2) Thoroughly clean fuel injector cylinder head bore with special Cummins wire brush tool or equivalent (Fig. 24). Blow out bore hole with compressed air.

**Fig. 24 Cleaning Cylinder Head Injector Bore—
TYPICAL BORE**

1 - INJECTOR BORE
2 - WIRE BRUSH

(3) The bottom of fuel injector is sealed to cylinder head bore with a copper sealing washer (shim) of a certain thickness. A new shim with correct thickness must always be re-installed after removing injector. Measure thickness of injector shim (Fig. 23). **Shim Thickness: 1.5 mm (.060")**

(4) Install new shim (washer) to bottom of injector (Fig. 22). Apply light coating of clean engine oil to washer. This will keep washer in place during installation.

(5) Install new o-ring to fuel injector. Apply small amount of clean engine oil to o-ring.

(6) Note fuel inlet hole on side of fuel injector. This hole must be positioned towards injector connector tube. Position injector into cylinder head bore being extremely careful not to allow injector tip to touch sides of bore. Press fuel injector into cylinder head with finger pressure only. **Do not use any tools to press fuel injector into position. Damage to machined surfaces may result.**

(7) Position fuel injector hold down clamp into shouldered bolt while aligning slot in top of injector into groove in bottom of clamp. Tighten opposite clamp bolt (Fig. 18) to 10 N·m (89 in. lbs.) torque.

(8) Install new o-ring to fuel injector connector tube. Apply small amount of clean engine oil to o-ring.

(9) Press injector connector tube into cylinder head with finger pressure only. **Do not use any tools to**

press tube into position. Damage to machined surfaces may result.

(10) Connect high-pressure fuel lines. Refer to High-Pressure Fuel Lines Removal/Installation. **The fuel line fitting torque is very critical.** If fitting is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside cylinder head and will not be visible resulting in a possible fuel injector miss and low power.

(11) Install valve cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(12) (If necessary) install intake manifold air heater assembly. Refer to Intake Manifold Air Heater Removal/Installation.

(13) (If necessary) install engine lifting bracket. Tighten 2 bolts to 77 N·m (57 ft. lbs.) torque.

(14) Connect negative battery cables to both batteries.

(15) Bleed air from high-pressure lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

FUEL INJECTION PUMP RELAY

DESCRIPTION

The fuel injection pump relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

OPERATION

The Engine Control Module (ECM) energizes the electric fuel injection pump through the fuel injection pump relay. Battery voltage is applied to the fuel injection pump relay at all times. When the key is turned ON, the relay is energized when a 12-volt signal is provided by the ECM. When energized, 12-volts is supplied to the Fuel Pump Control Module. The Fuel Pump Control Module is located on the top of the fuel injection pump and is non-servicable.

FUEL TEMPERATURE SENSOR

DESCRIPTION

Two different fuel temperature sensors are used. One of the sensors is located inside of the Bosch VP44 fuel injection pump and is a non-serviceable part. The other fuel temperature sensor is located in the top of the fuel filter housing and is serviceable (serviceable if replacing the fuel heater).

FUEL TEMPERATURE SENSOR (Continued)

OPERATION

The sensor located in the Bosch VP44 fuel injection pump is used to check fuel temperature within the injection pump and to set a Diagnostic Trouble Code (DTC) if a specific high fuel temperature has been reached. If high temperature has been reached, engine power will be de-rated by the Engine Control Module (ECM).

The sensor located in the top of the fuel filter housing is used to control the fuel heater element. Refer to Fuel Heater Description and Operation for additional information.

INTAKE AIR HEATER

DESCRIPTION

The intake manifold air heater element assembly is located in the top of the intake manifold (Fig. 25).

80b46b90

Fig. 25 Air Heater Elements Location

- 1 - AIR HEATER ELEMENTS
- 2 - LOWER GASKET
- 3 - BLOCK
- 4 - UPPER GASKET

OPERATION

The air heater elements are used to heat incoming air to the intake manifold. This is done to help engine starting and improve driveability with cool or cold outside temperatures.

Electrical supply for the 2 air heater elements is controlled by the Engine Control Module (ECM) through the 2 air heater relays. Refer to Intake Manifold Air Heater Relays for more information.

Two heavy-duty cables connect the 2 air heater elements to the 2 air heater relays. Each of these cables will supply approximately 95 amps at 12 volts to an individual heating element within the heater block assembly.

Refer to the Powertrain Diagnostic Procedures manual for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

REMOVAL

The 2 intake manifold air heater elements are attached to a metal block located at the top of the intake manifold (Fig. 26). If servicing either of the heater elements, the entire block/element assembly must be replaced.

80b46b90

Fig. 26 Intake Manifold Air Heater Element Location

- 1 - AIR HEATER ELEMENTS
- 2 - LOWER GASKET
- 3 - BLOCK
- 4 - UPPER GASKET

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect clamp from rubber hose at air intake housing.

(3) Disconnect rubber hose at air intake housing.

(4) Remove engine oil dipstick tube mounting bolt (Fig. 28). Position dipstick tube to the side.

(5) Disconnect heater electrical cables at cable mounting studs (Fig. 28).

(6) Disconnect ground cable bolt and ground cable from housing (Fig. 27).

(7) Remove 4 housing bolts (Fig. 28).

(8) Remove air intake housing from top of heater elements.

(9) Remove heater element assembly from intake manifold.

(10) Clean old gasket material from air intake housing and intake manifold.

(11) Clean old gasket material from both ends of heater block (Fig. 26).

- 2 - HOUSING BOLTS (2)
- 3 - INTAKE HEATER CABLE MOUNTING STUDS (2)
- 4 - DIPSTICK TUBE

INSTALLATION

The 2 intake manifold air heater elements are attached to a metal block located at the top of the

intake manifold (Fig. 26). If servicing either of the heater elements, the entire block/element assembly must be replaced.

(1) Using 2 new gaskets, position element assembly and air housing to intake manifold.

(2) Position ground cable (Fig. 27) to air housing.

(3) Install 4 housing bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(4) Connect heater cables at cable mounting studs (Fig. 28). **Do not allow the cable eyelets to contact any other metal source other than the cable nuts/studs.**

(5) Install engine oil dipstick tube and mounting bolt.

(6) Connect rubber hose to air intake housing.

(7) Connect clamp to rubber hose at air intake housing.

(8) Connect both negative battery cables at both batteries.

INTAKE AIR HEATER RELAY**DESCRIPTION**

The 2 intake manifold air heater relays are located in the engine compartment, attached to the left inner fender below the left battery (Fig. 29).

J9414-85

Fig. 29 Intake Manifold Air Heater Relays Location

- 1 - BATTERY (LEFT SIDE)

- 4 - INTAKE AIR HEATER RELAYS (2)
- 5 - RUBBER SHIELDS (4)
- 6 - CABLES TO BATTERY (+)

INTAKE AIR HEATER RELAY (Continued)

OPERATION

The Engine Control Module (ECM) operates the 2 heating elements through the 2 intake manifold air heater relays.

Refer to Powertrain Diagnostic Procedures for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

REMOVAL

The relays are located in engine compartment, bolted to left inner fender below left battery (Fig. 30).

Fig. 30 Intake Manifold Air Heater Relays

- 1 - BATTERY (LEFT SIDE)
- 2 - RELAY MOUNTING BOLTS (2)
- 3 - RELAY TRIGGER WIRES (4)
- 4 - INTAKE AIR HEATER RELAYS (2)
- 5 - RUBBER SHIELDS (4)
- 6 - CABLES TO BATTERY (+)

The mounting bracket and both relays are replaced as an assembly.

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect four relay trigger wires at both relays (Fig. 30). Note position of wiring before removing.

(3) Lift four rubber shields from all 4 cables (Fig. 30).

(4) Remove four nuts at cable connectors (Fig. 30). Note position of wiring before removing.

(5) Remove three relay mounting bracket bolts (Fig. 30) and remove relay assembly.

INSTALLATION

The relays are located in engine compartment, bolted to left inner fender below left battery (Fig. 30).

(1) Install relay assembly to inner fender. Tighten mounting bolts to 4.5 N·m (40 in. lbs.) torque.

(2) Connect eight electrical connectors to relays.

(3) Connect battery cables to both batteries.

INTAKE AIR TEMPERATURE SENSOR

DESCRIPTION - DIESEL

The intake manifold air temperature sensor is installed into the rear of the intake manifold (Fig. 31) with the sensor element extending into the air stream.

Fig. 31 Intake Manifold Air Temperature (IAT) Sensor Location

- 1 - MANIFOLD AIR PRESSURE (MAP) SENSOR
- 2 - REAR OF CYLINDER HEAD
- 3 - IAT SENSOR
- 4 - ELECTRICAL CONNECTOR
- 5 - ELECTRICAL CONNECTOR

OPERATION - DIESEL

The IAT provides an input voltage to the Engine Control Module (ECM) indicating intake manifold air temperature. The input is used along with inputs from other sensors for intake air heater element operation, for engine protection, fuel timing and fuel control. As the temperature of the air-fuel stream in the manifold varies, the sensor resistance changes. This results in a different input voltage to the ECM.

INTAKE AIR TEMPERATURE SENSOR (Continued)

REMOVAL - DIESEL

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 32).

Fig. 32 IAT Sensor

- 1 - SENSOR MOUNTING HOLES
- 2 - O-RING
- 3 - IAT SENSOR
- 4 - MAP SENSOR
- 5 - O-RING

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 32).

- (1) Disconnect electrical connector from IAT sensor (Fig. 32).
- (2) Remove IAT sensor from intake manifold (Fig. 33).
- (3) Discard sensor o-ring (Fig. 33).

INSTALLATION - DIESEL

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 32).

- (1) Clean sensor mounting hole (Fig. 33) of rust or contaminants.
- (2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.
- (3) Install IAT sensor into intake manifold. Tighten to 14 N·m (10 ft. lbs.) torque.
- (4) Connect sensor electrical connector.

Fig. 33 Intake Manifold Air Temperature (IAT) Sensor Location

- 1 - MANIFOLD AIR PRESSURE (MAP) SENSOR
- 2 - REAR OF CYLINDER HEAD
- 3 - IAT SENSOR
- 4 - ELECTRICAL CONNECTOR
- 5 - ELECTRICAL CONNECTOR

MAP SENSOR

DESCRIPTION - DIESEL

The MAP sensor is installed into the rear of the intake manifold (Fig. 31).

OPERATION - DIESEL

The MAP sensor reacts to air pressure changes in the intake manifold. It provides an input voltage to the Engine Control Module (ECM). As pressure changes, MAP sensor voltage will change. The change in MAP sensor voltage results in a different input voltage to the ECM. The ECM uses this input, along with inputs from other sensors to provide fuel timing, fuel control and engine protection. Engine protection is used to derate (drop power off) the engine if turbocharger pressure becomes too high.

MAP SENSOR (Continued)

REMOVAL - DIESEL

The MAP sensor is located in the left/rear side of the intake manifold (Fig. 34).

Fig. 34 MAP Sensor Location

- 1 - MANIFOLD AIR PRESSURE (MAP) SENSOR
- 2 - REAR OF CYLINDER HEAD
- 3 - IAT SENSOR
- 4 - ELECTRICAL CONNECTOR
- 5 - ELECTRICAL CONNECTOR

The MAP sensor is located in the left/rear side of the intake manifold (Fig. 34).

- (1) Disconnect electrical connector from MAP sensor (Fig. 34).
- (2) Remove MAP sensor from intake manifold (Fig. 35).
- (3) Discard sensor o-ring (Fig. 35).

INSTALLATION

The MAP sensor is located in the left/rear side of the intake manifold (Fig. 34).

- (1) Clean sensor mounting hole (Fig. 35) of rust or contaminants.
- (2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.
- (3) Install MAP sensor into intake manifold. Tighten to 14 N·m (10 ft. lbs.) torque.
- (4) Connect sensor electrical connector.

PTO SWITCH

OPERATION

This Engine Control Module (ECM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

The input is used to tell the ECM that the PTO has been engaged. When engaged, the ECM will disable certain OBD II functions until the PTO has been turned off.

THROTTLE CONTROL CABLE

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 21). The plastic cable retainer snaps into pedal arm.

(3) Remove cable core wire at pedal arm.

(4) From inside vehicle, pinch both sides of plastic cable housing retainer tabs at dash panel (Fig. 21).

(5) Remove cable housing from dash panel and pull cable into engine compartment.

(6) Remove cable cover (Fig. 36). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 36). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(7) Using 2 screwdrivers, pry cable connector socket from throttle lever ball (Fig. 37). **Be very careful not to bend throttle lever arm.**

Fig. 35 MAP Sensor Removal/Installation

- 1 - SENSOR MOUNTING HOLES
- 2 - O-RING
- 3 - IAT SENSOR

- 2 - PUSH UP LOWER TAB
- 3 - SCREWS/CLIPS (2)
- 4 - TAB PUSH HERE

(8) Squeeze 2 pinch tabs on sides of throttle cable at mounting bracket (Fig. 37) and push cable rearward out of bracket .

INSTALLATION

(1) Install cable through mounting hole on cable mounting bracket (Fig. 37). Cable snaps into bracket. Be sure 2 pinch tabs are secure.

(2) Using large pliers, connect cable end socket to throttle lever ball (snaps on).

(3) Install remaining cable housing end into and through dash panel opening (snaps into position). The two plastic pinch tabs (Fig. 21) should lock cable to dash panel.

(4) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable

**Fig. 37 Throttle Cable at Throttle Lever**

- 1 - PINCH (2) TABS
- 2 - CABLE MOUNTING BRACKET
- 3 - PINCH TABS (2)
- 4 - OFF

- 10 - SPEED CONTROL CABLE

retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 21). Align index slot on plastic cable retainer to this index tab.

(5) Connect negative battery cables to both batteries.

(6) Before starting engine, operate accelerator pedal to check for any binding.

(7) Install cable/lever cover.

STEERING

TABLE OF CONTENTS

	page		page
STEERING		COLUMN	6
DESCRIPTION	1	GEAR	14
OPERATION	1	PUMP	31
DIAGNOSIS AND TESTING	2	LINKAGE - 2WD	38
POWER STEERING SYSTEM	2	LINKAGE - 4WD	40
POWER STEERING FLOW AND PRESSURE	4		

STEERING

DESCRIPTION

The power steering system consist of a steering column, steering gear and hydraulic pump. The gear is mounted to the frame rail and attaches to the steering linkage. The pump is a constant flow rate and displacement vane-type pump. The pump supplies hydraulic fluid pressure to the power steering gear (Fig. 1).

Vehicles equipped with trailer tow option have a power steering pump oil cooler.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft, turns the pitman shaft, which turns the steering linkage.

J9219-65

Fig. 1 Power Steering Gear & Pump

STEERING (Continued)

DIAGNOSIS AND TESTING - POWER STEERING SYSTEM

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONAL HISS OR WHISTLE	<ol style="list-style-type: none"> 1. Steering intermediate shaft to dash panel seal. 2. Noisy valve in power steering gear. 	<ol style="list-style-type: none"> 1. Check and repair seal at dash panel. 2. Repair steering gear.
RATTLE OR CLUNK	<ol style="list-style-type: none"> 1. Gear mounting bolts loose. 2. Loose or damaged suspension components. 3. Loose or damaged steering linkage. 4. Internal gear noise. 5. Pressure hose in contact with other components. 6. Loose or damaged intermediate shaft or column. 	<ol style="list-style-type: none"> 1. Tighten bolts to specification. 2. DIAGNOSIS AND TESTING - POWER STEERING FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 (Fig. 2) and Adapter Kit 6893.

Fig. 2 Pressure Test Gauge

- 1 - GAUGE HOSE
- 2 - TUBE
- 3 - ADAPTER FITTINGS
- 4 - ANALYZER

POWER STEERING ANALYZER INSTALLATION

WITHOUT HYDRAULIC BOOSTER

- (1) Remove the high pressure hose from the power steering pump.
- (2) Connect Tube 6844 into the pump hose fitting.

(3) Connect pressure gauge hose from the Power Steering Analyzer to Tube 6844.

(4) Connect Adapter 6826 to Power Steering Analyzer test valve end.

(5) Connect the power steering hose from the steering gear to Adapter 6826.

WITH HYDRAULIC BOOSTER

(1) Remove high pressure hose which goes to the steering gear from the tube coming out of the booster.

(2) Connect Adapter 6826 to the Power Steering Analyzer pressure gauge hose.

(3) Connect pressure gauge hose to the tube coming out of the booster.

(4) Connect Tube 6844 to the steering gear hose and Power Steering Analyzer test valve end.

FLOW AND PRESSURE TEST

- (1) Check belt condition and tension.
- (2) Open the test valve completely.
- (3) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.
- (4) Check fluid level, add fluid as necessary. Start engine again and let idle.
- (5) Gauge should read below 1034 kPa (150 psi), if above, inspect the hoses for restrictions and repair as necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).
- (6) Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification (Refer to pump specification chart for GPM) the pump should be replaced.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

STEERING (Continued)

(7) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

(8) Open the test valve and turn the steering wheel to the extreme left and right positions three times against the stops. Record the highest pressure reading at each position. Compare the readings to the pump specifications chart. If pressures readings are not within 50 psi of each other, the gear is leaking internally and must be repaired.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

PUMP SPECIFICATION

ENGINE	RELIEF PRESSURE (P.S.I.)	FLOW (G.P.M.) at 1500 RPM
3.9L	1450 to 1550	2.7 to 3.1
5.2L	1450 to 1550	2.7 to 3.1
5.9L	1450 to 1550	2.7 to 3.1
8.0L	1450 to 1550	2.7 to 3.1
5.9L Diesel	1450 to 1550	3.1 to 3.5
All With Hydraulic Booster	1450 to 1550	3.1 to 3.5

NOTE: After performing test and removing Power Steering Analyzer, check power steering fluid level.

COLUMN

DESCRIPTION

The tilt and standard column (Fig. 1) has been designed to be serviced as an assembly; less wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or the air-bag, refer to the WARNINGS and CAUTIONS below.

J9419-17

Fig. 1 Steering Column

- 1 - STEERING WHEEL

- 10 - NUT

COLUMN (Continued)

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

CAUTION: Do not hammer on steering column shaft or shift tube. This may cause the shaft/shift tube to collapse or damage the bearing.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Do not remove shaft lock plate, plate retainer, park lock link or slider. This will damage the column (Fig. 2) and (Fig. 3) .

Fig. 2 Observe Cautions

- 1 - CAUTION: NEVER REMOVE IGNITION LOCKING LINK
- 2 - CAUTION: NEVER REMOVE PARK LOCK SLIDER
- 3 - CAUTION: NEVER REMOVE SHAFT LOCK PLATE

REMOVAL

- (1) Position the front wheels straight ahead.
- (2) Disconnect the negative (ground) cable from the battery.

Fig. 3 Observe Cautions

- 1 - CAUTION: NEVER REMOVE SHAFT LOCK PLATE RETAINER

(3) Remove the airbag, (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(4) Remove the steering wheel with an appropriate puller, (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).

CAUTION: Ensure the puller bolts are fully engaged into the steering wheel and not into the clock-spring, before attempting to remove the wheel. Failure to do so may damage the steering wheel.

(5) Remove the shift link rod in the engine compartment (if equipped). Pry the rod out from the grommet in the shift lever.

(6) Scribe or paint reference mark on the column shaft-to-coupler. This will aid in column shaft installation alignment. Remove the steering column shaft-to-coupler bolt (Fig. 4).

(7) Remove the steering column opening cover/knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(8) Remove the PRNDL cable on column shift vehicles. Put the shift lever in **Park** position. Pull the cable and twist to remove from the position arm. Push the tab up on bottom of the cable retainer, then squeeze sides to remove retainer from the column (Fig. 5).

(9) Remove the tilt lever (if equipped) from the column.

(10) Remove the upper and lower lock housing shroud and remove the lower fixed shroud.

(11) Remove the turn signal multi-function switch connector with a 7mm socket (Fig. 6).

(12) Loosen the upper Support Bracket nuts to allow some slack. This will aid in removal of the upper fixed shroud.

(13) Remove the electrical connections from Key-in light, Ignition Switch, Horn, Overdrive Switch and Clock Spring (Speed Control) (Fig. 7).

(14) Remove the wiring harness from the column by prying out the plastic retainer buttons.

(15) Remove the toe plate fasteners.

(16) Remove the column from vehicle.

(17) Remove the Ignition and Multi-Function Switch, then remove the Clock Spring and tape the Clock Spring to prevent it from turning. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING REMOVAL).

J918J-1

- 4 - IGNITION SWITCH
- 5 - SPEED CONTROL

INSTALLATION

(1) Install the clock spring and switches, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

NOTE: Turn the Ignition Switch to the on position and verify the gear shifter moves. If the shifter does not move ensure the Ignition Switch is installed properly.

(2) Column shift vehicles, install a new grommet. Use multi-purpose lubricant, or equivalent, to aid installation of the grommet.

COLUMN (Continued)

NOTE: A new grommet should be used when ever the rod is disconnected from the lever.

- (3) Remove the shipping lock pin if necessary.
- (4) Install the column through the floor pan.
- (5) Position the column bracket breakaway capsules on the mounting studs. Install, but **loose assemble** the two upper bracket nuts.
- (6) With the front wheels in the straight-ahead position. Align steering column shaft to the coupler. Install a **new** pinch bolt and tighten to 49 N·m (36 ft. lbs.).
- (7) Clip the wiring harness on the steering column. Connect the multi- function switch wiring and tighten with 7mm socket.
- (8) Install the upper fixed shroud.
- (9) Be sure both breakaway capsules are fully seated in the slots in the column support bracket. Pull the column rearward then tighten upper bracket nuts to 12 N·m (105 in. lbs.).
- (10) Tighten the toe plate to floor pan attaching nuts to 22.5 N·m (200 in. lbs.).
- (11) Install the wiring connections to the column. Install the lower fixed shroud.

(12) Column shift vehicles, install the PRNDL driver cable. Place shifter in Park position. If indicator needs adjusting, turn thumb screw on cable retainer to adjust cable.

(13) Install the lock housing shrouds. Install the tilt lever (if equipped).

(14) Install the knee blocker and steering column opening cover, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(15) Install steering wheel and tighten nut to 61 N·m (45 ft. lbs.), (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

(16) Install the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

(17) Column shift vehicles, connect the shift link rod to the transmission shift lever. Use multi-purpose lubricant, or an equivalent product, to aid the installation.

(18) Install the battery ground (negative) cable.

(19) Verify operation of the automatic transmission shift linkage and adjust as necessary, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 44RE/GEAR SHIFT CABLE - ADJUSTMENTS).

KEY-IN IGNITION SWITCH

DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the right side of the steering column. It closes a path to ground for the Central Timer Module (CTM) when the ignition key is inserted in the ignition lock cylinder and the

driver door ajar switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition lock cylinder. The ground path is also opened when the driver door ajar switch is open (driver door is closed).

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced.(Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

KEY-IN IGNITION SWITCH (Continued)

DIAGNOSIS AND TESTING - IGNITION SWITCH AND KEY LOCK CYLINDER

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to Ignition Switch in the appropriate section of Electrical Wiring Diagrams.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Vehicles equipped with an automatic transmission and a floor mounted shifter: a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is rotated to the LOCKED or ACCESSORY position. The interlock device within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

If the ignition key is difficult to rotate to or from the LOCK or ACCESSORY position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. Refer to Brake Transmission Shift Interlock Cable Adjustment in Transmissions for adjustment procedures.

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is in the LOCKED or ACCESSORY position. If it is difficult to rotate the key to or from the LOCK or ACCESSORY position, the interlock device within the steering column may be defective. This device is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a lever is located on the steering column behind the ignition key lock cylinder. The lever must be manually operated to allow rotation of the ignition key lock cylinder to the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

On other models, the ignition key cylinder must be depressed to allow it to be rotated into the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lock

mechanism within the steering column may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

LOCK CYLINDER HOUSING

REMOVAL

The ignition key must be in the key cylinder for cylinder removal.

- (1) Disconnect negative cable from battery.
- (2) If equipped with tilt column, remove tilt lever by turning it counterclockwise.
- (3) Remove upper and lower covers (shrouds) from steering column (Fig. 8).

Fig. 8 Shroud Removal/Installation—Typical

- 3 - TILT LEVER
- 4 - UPPER SHROUD
- 5 - PANEL BRACKET
- 6 - SPACER
- 7 - NUT
- 8 - LOWER SHROUD
- 9 - CLOCK SPRING

(4) If equipped with automatic transmission, place shifter in PARK position.

(5) A retaining pin (Fig. 9) is located at side of key cylinder assembly.

- (a) Rotate key to RUN position.

LOCK CYLINDER HOUSING (Continued)

(b) Press in on retaining pin while pulling key cylinder from ignition switch.

80a592b6

Fig. 9 Retaining Pin

- 1 - IGNITION SWITCH
- 2 - KEY/KEY CYLINDER (RUN POSITION)
- 3 - RETAINING PIN

INSTALLATION

The ignition key must be in the key cylinder for cylinder installation.

(1) Install the lock cylinder into the housing using care to align the end of the lock cylinder with the ignition switch.

(2) Push the lock cylinder in until it clicks.

IGNITION SWITCH

DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key lock cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

Vehicles equipped with an automatic transmission and a floor mounted shifter: a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is rotated to the LOCKED or ACCESSORY position. The interlock device within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

If the ignition key is difficult to rotate to or from the LOCK or ACCESSORY position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. Refer to Brake Transmission Shift Interlock Cable Adjustment in Group 21, Transmissions for adjustment procedures.

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is in the LOCKED or ACCESSORY position. If it is difficult to rotate the key to or from the LOCK or ACCESSORY position, the interlock device within the steering column may be defective. This device is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a lever is located on the steering column behind the ignition key lock cylinder. The lever must be manually operated to allow rotation of the ignition key lock cylinder to the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

On other models, the ignition key cylinder must be depressed to allow it to be rotated into the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lock mechanism within the steering column may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

DIAGNOSIS AND TESTING - IGNITION SWITCH

TEST AND REPAIR

If the key removal effort is excessive on a vehicle with a automatic transmission first adjust the shift linkage, (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC - 42RE/GEAR SHIFT CABLE - ADJUSTMENTS).

If the ignition switch effort is excessive remove the ignition key cylinder from the steering column. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - INSTALLATION). Check the turning effort of the key cylinder. If the ignition key cylinder effort is excessive replace the key cylinder. If the

IGNITION SWITCH (Continued)

ignition key cylinder operates properly look for the following conditions.

- (1) Look for rough areas or flash in the casting and if found remove with a file (Fig. 10).
- (2) Grease the lock plate actuator, lock plate, slider and locking link.

80b/e145

Fig. 10 Steering Column Flash Removal

- 1 - FILE THIS AREA TO REMOVE FLASHING AND PROVIDE CLEARANCE TO ELIMINATE BINDING
- 2 - PARK LOCK SLIDER
- 3 - CAUTION: NEVER REMOVE SHAFT LOCK PLATE

REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Remove key cylinder, (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - REMOVAL).
- (2) Remove lower steering column cover screws and remove cover (Fig. 8).
- (3) Remove ignition switch mounting screw (Fig. 13). Use tamper proof torx bit to remove the screw.
- (4) Using a small screwdriver, push on locking tab (Fig. 11) and remove switch from steering column.
- (5) Disconnect two electrical connectors at rear of ignition switch (Fig. 13).

INSTALLATION

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Before installing ignition switch, rotate the slot in the switch to the ON position (Fig. 12).
- (2) Connect two electrical connectors to rear of ignition switch. Make sure that locking tabs are fully seated into wiring connectors.

GEAR SHIFT LEVER

REMOVAL

(1) Support the steering column assembly as shown in (Fig. 14) using a suitable size socket and back-up support.

(2) Disconnect over drive switch wiring.

(3) Using a drift of the appropriate size drive the knurled pin out of the steering column and gear shift lever. Remove the gear shift lever from the steering column assembly.

CAUTION: The pin can only be removed from the direction shown (Fig. 14).

INSTALLATION

(1) Support the steering column using a suitable size socket and back-up support.

(2) Install the gear shift lever into the steering column assembly. Align the pin holes in the gear shift lever and the steering column assembly.

CAUTION: The pin must be installed in the original direction.

(3) Carefully Install the pin into the steering column assembly and through the shift lever. If the pin binds check the alignment on the holes. Be sure pin is fully installed into the steering column assembly.

(4) Connect over drive switch wiring.

STEERING WHEEL

REMOVAL

For steering wheel removal procedure, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL) .

INSTALLATION

For steering wheel installation procedure, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

GEAR

DESCRIPTION

The power steering gear is a recirculating ball type gear (Fig. 1). The gear ratio's used are 17.5:1 and 14:1.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a

bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft, turns the pitman shaft, which turns the steering linkage.

DIAGNOSIS AND TESTING - POWER STEERING GEAR LEAKAGE

(1) Possible power steering gear leakage areas. (Fig. 2).

4. PITMAN SHAFT SEALS - REPLACE THE SEALS.
5. TOP COVER SEAL - REPLACE THE SEAL.

80a1c3c2

Fig. 2 STEERING GEAR**REMOVAL**

- (1) Place the front wheels in a straight-ahead position.
- (2) Disconnect and cap the fluid hoses from steering gear.
- (3) Remove coupler pinch bolt at the steering gear and slide shaft off gear (Fig. 3).

J9419-20

Fig. 3 Column Shaft

- 1 - STEERING GEAR
- 2 - STEERING COUPLER

- (4) Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from the shaft with Puller C-4150A (Fig. 4).

J9519-2

Fig. 4 Pitman Arm

- 1 - PITMAN ARM
- 2 - SPECIAL TOOL C-4150-A
- 3 - WRENCH

- (5) Remove steering gear retaining bolts and nuts. Remove the steering gear from the vehicle.

INSTALLATION

- (1) Position the steering gear on the frame rail and install the bolts. Tighten mounting bolts to specifications.
- (2) Align steering coupler on gear shaft. Install pinch bolt and tighten to 49 N·m (36 ft. lbs.) torque.
- (3) Align and install the pitman arm.
- (4) Install the washer and retaining nut on the pitman shaft. Tighten the nut to 251 N·m (185 ft. lbs.).
- (5) Connect fluid hoses to steering gear, tighten to 31 N·m (23 ft. lbs.). Add fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

ADJUSTMENTS

CAUTION: Steering gear must be adjusted in the proper order. If adjustments are not performed in order, gear damage and improper steering response may result.

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

GEAR (Continued)

WORM THRUST BEARING PRELOAD

- (1) Mount the gear carefully into a vise.

CAUTION: Do not overtighten the vise on the gear case. This may affect the adjustment

- (2) Remove adjuster plug locknut (Fig. 5) .
 (3) Rotate the stub shaft back and forth with a 12 point socket to drain the remaining fluid.

Fig. 5 Adjuster Lock Nut

- 1 - ADJUSTER NUT
 2 - STEERING GEAR
 3 - LOCK NUT
 4 - PUNCH

- (4) Turn the adjuster in with Spanner Wrench C-4381. Tighten the plug and thrust bearing in the housing until firmly bottomed in the housing about 28-31 N·m (20-23 ft. lbs.).

- (5) Place an index mark on the housing even with one of the holes in adjuster plug (Fig. 6) .

- (6) Measure back (counterclockwise) 18 mm (0.70 in) and mark the housing (Fig. 7) .

- (7) Rotate adjustment cap back (counterclockwise) with spanner wrench until hole is aligned with the second mark (Fig. 8) .

- (8) Install and tighten lock nut to 108 N·m (80 ft. lbs.). Be sure adjustment cap does not turn while tightening the lock nut.

PITMAN SHAFT OVER-CENTER PRELOAD

NOTE: Before performing this procedure, the worm bearing preload adjustment must be performed.

- (1) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

- (2) Starting at either stop, turn the stub shaft back 1/2 the total number of turns. This is the center of the gear travel (Fig. 9) .

J8919-58

Fig. 6 Alignment Marking On Housing

1 - INDEX

J8919-59

Fig. 7 Second Marking On Housing

1 - REFERENCE MARK

- (3) Place the torque wrench in the vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range (Fig. 10) . This is the Over-Center Rotating Torque.

NOTE: The stub shaft must rotate smoothly without sticking or binding.

GEAR (Continued)

J9219-30

Fig. 8 Aligning To The Second Mark

- 1 - FIRST MARK
- 2 - SECOND MARK
- 3 - SPANNER WRENCH

J8919-62

Fig. 9 Steering Gear Centered

- 1 - ADJUSTMENT SCREW
- 2 - MASTER SPLINE

(4) Rotate the stud shaft between 180° and 270° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.

(5) The Over-Center Rotating Torque should be 0.23-0.68 N·m (2-6 in. lbs.) **higher** than the Preload Rotating Torque.

(6) If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back (COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.

80b34e43

Fig. 10 Checking Over-center Rotation Torque

- 1 - CENTER

(7) Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat measurement until correct Over-Center Rotating Torque is reached.

NOTE: To increase the Over-Center Rotating Torque turn the screw **CLOCKWISE**.

(8) Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 49 N·m (36 ft. lbs.).

PITMAN BEARING

REMOVAL

(1) Clean exposed end of pitman shaft and housing with a wire brush.

(2) Remove preload adjuster nut (Fig. 11).

(3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

(4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

(5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 11).

NOTE: The pitman shaft will not clear the housing if it is not centered.

(6) Remove pitman shaft from the side cover.

(7) Remove dust seal from the housing with a seal pick (Fig. 12).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

(8) Remove retaining ring with snap ring pliers.

(9) Remove washer from the housing.

(11) Remove pitman shaft bearing from housing with a bearing driver and handle (Fig. 13).

Fig. 13 Needle Bearing Removal

- 1 - REMOVER
2 - SIDE COVER AREA

INSTALLATION

(1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 14). Drive bearing into housing until the driver bottoms out.

NOTE: Install upper pitman shaft bearing with the part number/letters facing the driver.

(2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 15). Drive bearing into housing until the bearing shoulder is seated against the housing.

(3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.

(4) Install the oil seal with Driver 8294 and Handle C-4171.

(5) Install plastic backup washer.

NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

- (6) Install metal backup washer.
(7) Install the retainer ring with snap ring pliers.

(8) Coat the dust seal with **special grease** supplied with the new seal.

(9) Install dust seal with Driver 8294 and Handle C-4171.

(10) Install new pitman shaft cover o-ring.

(11) Install pitman shaft assembly into the housing.

(12) Install cover bolts and tighten to 62 N-m (46 ft. lbs.).

(13) Perform over-center rotation torque adjustment, (Refer to 19 - STEERING/GEAR - DIAGNOSIS AND TESTING).

PITMAN SHAFT

REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Remove preload adjuster nut (Fig. 16).
- (3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.
- (4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.
- (5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 16).

NOTE: The pitman shaft will not clear the housing if it is not centered.

INSTALLATION

- (1) Install pitman shaft bearing into housing with a bearing driver and handle.
- (2) Coat the oil seal and washer with **special grease** supplied with the new seal.
- (3) Install the oil seal with a driver and handle.
- (4) Install backup washer.
- (5) Install the retainer ring with snap ring pliers.
- (6) Coat the dust seal with **special grease** supplied with the new seal.
- (7) Install dust seal with a driver and handle.
- (8) Install pitman shaft to side cover by screwing shaft in until it fully seats to side cover.
- (9) Install preload adjuster nut. **Do not tighten nut until after Over-Center Rotation Torque adjustment has been made.**
- (10) Install gasket to side cover and bend tabs around edges of side cover (Fig. 11).
- (11) Install pitman shaft assembly and side cover to housing.
- (12) Install side cover bolts and tighten to 60 N·m (44 ft. lbs.).
- (13) Perform over-center rotation torque adjustment, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

- 6 - HOUSING ASSEMBLY

PITMAN SHAFT SEAL

REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Remove preload adjuster nut (Fig. 19).
- (3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.
- (4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.
- (5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 19).

NOTE: The pitman shaft will not clear the housing if it is not centered.

- (6) Remove pitman shaft from the side cover.
- (7) Remove dust seal from the housing with a seal pick (Fig. 20).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

- (8) Remove retaining ring with snap ring pliers.
- (9) Remove washer from the housing.
- (10) Remove oil seal from the housing with a seal pick.
- (11) Remove pitman shaft bearing from housing with a bearing driver and handle (Fig. 21).

PITMAN SHAFT SEAL (Continued)

**Fig. 21 Needle Bearing Removal**

- 1 - REMOVER
2 - SIDE COVER AREA

INSTALLATION

(1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 22). Drive bearing into housing until the driver bottoms out.

NOTE: Install upper pitman shaft bearing with the part number/letters facing the driver.

**Fig. 22 Upper Pitman Shaft Bearing**

- 1 - DRIVER
2 - UPPER BEARING

(2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 23).

Drive bearing into housing until the bearing shoulder is seated against the housing.

80b6b1a6

Fig. 23 Lower Pitman Shaft Bearing

- 1 - STEERING GEAR
2 - BEARING SHOULDER
3 - DRIVER
4 - LOWER BEARING

(3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.

(4) Install the oil seal with Driver 8294 and Handle C-4171.

(5) Install plastic backup washer.

NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

(6) Install metal backup washer.

(7) Install the retainer ring with snap ring pliers.

(8) Coat the dust seal with **special grease** supplied with the new seal.

(9) Install dust seal with Driver 8294 and Handle C-4171.

(10) Install new pitman shaft cover o-ring.

(11) Install pitman shaft assembly into the housing.

(12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).

(13) Perform over-center rotation torque adjustment, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

SPOOL VALVE**REMOVAL**

(1) Remove lock nut (Fig. 24).

(2) Remove adjuster nut with Spanner Wrench C-4381.

SPOOL VALVE (Continued)

(3) Remove thrust support assembly out of the housing (Fig. 25).

(4) Pull stub shaft and valve assembly from the housing (Fig. 26).

Fig. 24 Lock Nut and Adjuster Nut

- 6 - VALVE ASSEMBLY

Fig. 27 Stub Shaft

- 1 - STUB SHAFT
- 2 - VALVE BODY
- 3 - HOLE IN SPOOL
- 4 - SHAFT PIN
- 5 - 6mm (1/4")

(7) Remove spool valve O-ring and valve body teflon rings and O-rings underneath the teflon rings (Fig. 29).

SPOOL VALVE (Continued)

**Fig. 28 Spool Valve**

- 1 - SPOOL VALVE
2 - ROTATE VALVE TO REMOVE
3 - VALVE BODY

**Fig. 29 Valve Seals**

- 1 - O-RING SEALS

(8) Remove the O-ring between the worm shaft and the stub shaft.

INSTALLATION

NOTE: Clean and dry all components, then lubricate with power steering fluid.

- (1) Install spool valve spool O-ring.
- (2) Install spool valve in valve body by pushing and rotating. Hole in spool valve for stub shaft pin must be accessible from opposite end of valve body.
- (3) Install stub shaft in valve spool and engage locating pin on stub shaft into spool valve hole (Fig. 30).

NOTE: Notch in stub shaft cap must fully engage valve body pin and seat against valve body shoulder.

**Fig. 30 Stub Shaft Installation**

- 1 - NOTCH IN CAP
2 - VALVE BODY PIN

- (4) Install O-rings and teflon rings over the O-rings on valve body.
- (5) Install O-ring into the back of the stub shaft cap (Fig. 31).
- (6) Install stub shaft and valve assembly in the housing. Line up worm shaft to slots in the valve assembly.
- (7) Install thrust support assembly.

NOTE: The thrust support is serviced as an assembly. If any component of the thrust support is damaged the assembly must be replaced.

- (8) Install adjuster nut and lock nut.
- (9) Adjust Thrust Bearing Preload and Over-Center Rotating Torque, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

SPOOL VALVE (Continued)

**Fig. 31 Stub Shaft Cap O-Ring**

- 1 - VALVE BODY
- 2 - STUB SHAFT CAP
- 3 - O-RING

STEERING GEAR HOUSING
PLUG

REMOVAL

(1) Unseat and remove retaining ring from groove with a punch through the hole in the end of the housing (Fig. 32).

**Fig. 32 End Plug Retaining Ring**

- 1 - RETAINING RING

(2) Slowly rotate stub shaft with 12 point socket COUNTER-CLOCKWISE to force the end plug out from housing.

CAUTION: Do not turn stub shaft any further than necessary. The rack piston balls will drop out of the rack piston circuit if the stub shaft is turned too far.

(3) Remove O-ring from the housing (Fig. 33).

**Fig. 33 End Plug Components**

- 1 - HOUSING ASSEMBLY
- 2 - HOUSING END PLUG O-RING SEAL
- 3 - HOUSING END PLUG
- 4 - RETAINING RING

INSTALLATION

(1) Lubricate O-ring with power steering fluid and install into the housing.

(2) Install end plug by tapping the plug lightly with a plastic mallet into the housing.

(3) Install retaining ring so one end of the ring covers the housing access hole (Fig. 34).

WORM SHAFT

REMOVAL

(1) Remove housing end plug, (Refer to 19 - STEERING/GEAR/STEERING GEAR HOUSING PLUG - REMOVAL).

(2) Remove rack piston plug (Fig. 35).

(3) Remove side cover and pitman shaft.

(4) Turn stub shaft COUNTERCLOCKWISE until the rack piston begins to come out of the housing.

(5) Insert Arbor C-4175 into bore of rack piston (Fig. 36) and hold tool tightly against worm shaft.

(6) Turn the stub shaft with a 12 point socket COUNTERCLOCKWISE, this will force the rack pis-

- 4 - RATCHET

ton onto the tool and hold the rack piston balls in place.

(7) Remove the rack piston and tool together from housing.

(8) Remove tool from rack piston.

(9) Remove rack piston balls.

(10) Remove clamp bolts, clamp and ball guide (Fig. 37).

(11) Remove teflon ring and O-ring from the rack piston (Fig. 38).

**Fig. 37 Rack Piston**

- 1 - CLAMP
- 2 - BALLS
- 3 - RACK PISTON
- 4 - BALL GUIDE

(12) Remove the adjuster lock nut and adjuster nut from the stub shaft.

(13) Pull the stub shaft with the spool valve and thrust support assembly out of the housing.

(14) Remove the worm shaft from the housing (Fig. 39).

WORM SHAFT (Continued)

**Fig. 38 Rack Piston Teflon Ring and O-Ring**

- 1 - TEFLON SEAL
- 2 - BACK-UP O-RING MUST BE INSTALLED UNDER PISTON RING
- 3 - RACK PISTON NUT

**Fig. 39 Worm Shaft**

- 1 - GEAR HOUSING
- 2 - BEARING RACE
- 3 - WORM SHAFT
- 4 - BEARING

INSTALLATION

NOTE: Clean and dry all components and lubricate with power steering fluid.

(1) Check for scores, nicks or burrs on the rack piston finished surface. Slight wear is normal on the worm gear surfaces.

(2) Install O-ring and teflon ring on the rack piston.

(3) Install worm shaft in the rack piston and align worm shaft spiral groove with rack piston ball guide hole (Fig. 40).

**Fig. 40 Installing Balls in Rack Piston**

- 1 - INSTALL BALLS IN THIS HOLE WHILE SLOWLY ROTATING WORM COUNTER CLOCKWISE
- 2 - WORM FLANGE

CAUTION: The rack piston balls must be installed alternately into the rack piston and ball guide. This maintains worm shaft preload. There are 12 black balls and 12 silver (Chrome) balls. The black balls are smaller than the silver balls.

(4) Lubricate and install rack piston balls through return guide hole while turning worm shaft COUNTERCLOCKWISE (Fig. 40).

(5) Install remaining balls in guide using grease to hold the balls in place (Fig. 41).

(6) Install the guide onto rack piston and install clamp and clamp bolts. Tighten bolts to 4.8 N-m (43 in. lbs.).

(7) Insert Arbor C-4175 into bore of rack piston and hold tool tightly against worm shaft.

(8) Turn the worm shaft COUNTERCLOCKWISE while pushing on the arbor. This will force the rack piston onto the arbor and hold the rack piston balls in place.

(9) Install the races and thrust bearing on the worm shaft and install shaft in the housing (Fig. 39).

(10) Install the stub shaft with spool valve, thrust support assembly and adjuster nut in the housing.

WORM SHAFT (Continued)

J9319-40

Fig. 41 Balls in the Return Guide

- 1 - GUIDE
- 2 - PETROLEUM JELLY
- 3 - BALLS

(11) Install the rack piston and arbor tool into the housing.

(12) Hold arbor tightly against worm shaft and turn stub shaft **CLOCKWISE** until rack piston is seated on worm shaft.

(13) Install pitman shaft and side cover in the housing.

(14) Install rack piston plug and tighten to 150 N·m (111 ft. lbs.).

(15) Install housing end plug, (Refer to 19 - STEERING/GEAR/STEERING GEAR HOUSING PLUG - INSTALLATION).

(16) Adjust worm shaft thrust bearing preload and over-center rotating torque, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

PUMP

DESCRIPTION

The P-Series pump is used on these vehicles (Fig. 1). The pump shaft has a pressed-on pulley that is belt driven by the crankshaft pulley on gasoline engines. The pump is driven off the back of the vacuum pump on the diesel engine.

Trailer tow option vehicles are equipped with a power steering pump oil cooler. The oil cooler is mounted to the front crossmember.

NOTE: Power steering pumps are not interchangeable with pumps installed on other vehicles.

RH13

Fig. 1 P-Series—Pump

- 1 - RESERVOIR CAP AND DIPSTICK
2 - RESERVOIR

OPERATION

Hydraulic pressure is provided by the pump for the power steering gear. The power steering pump is a constant flow rate and displacement, vane-type pump. The pump is connected to the steering gear via the pressure hose and the return hose. On vehicles equipped with a hydraulic booster, the pump supplies the hydraulic pressure for the booster.

DIAGNOSIS AND TESTING - PUMP LEAKAGE

- (1) Possible pump leakage areas. (Fig. 2).

STANDARD PROCEDURE - POWER STEERING PUMP - INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal temperature.

- (1) Turn steering wheel all the way to the left
- (2) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.
- (3) Raise the front wheels off the ground.
- (4) Slowly turn the steering wheel lock-to-lock 20 times with the engine off while checking the fluid level.

PUMP (Continued)

**Fig. 2 Power Steering Pump**

80abfe6a

1 - CHECK OIL LEVEL; IF LEAKAGE PERSISTS WITH THE CORRECT LEVEL AND CAP TIGHT, REPLACE THE CAP
2 - SHAFT SEAL

3 - RESERVOIR O-RING
4 - O-RING SEAL

NOTE: Vehicles with long return lines or oil coolers turn wheel 40 times.

(5) Start the engine. With the engine idling maintain the fluid level.

(6) Lower the front wheels and let the engine idle for two minutes.

(7) Turn the steering wheel in both direction and verify power assist and quit operation of the pump.

If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

STANDARD PROCEDURE - FLUSHING POWER STEERING SYSTEM

Flushing is required when the power steering/hydraulic booster system fluid has become contaminated. Contaminated fluid in the steering/booster system can cause seal deterioration and affect steering gear/booster spool valve operation.

(1) Raise the front end of the vehicle off the ground until the wheels are free to turn.

(2) Remove the return line from the pump.

NOTE: If vehicle is equipped with a hydraulic booster remove both return lines from the pump.

(3) Plug the return line port/ports at the pump.

(4) Position the return line/lines into a large container to catch the fluid.

(5) While an assistant is filling the pump reservoir start the engine.

(6) With the engine running at idle turn the wheel back and forth.

NOTE: Do not contact or hold the wheel against the steering stops.

(7) Run a quart of fluid through the system then stop the engine and install the return line/lines.

PUMP (Continued)

(8) Fill the system with fluid and perform Steering Pump Initial Operation, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(9) Start the engine and run it for fifteen minutes then stop the engine.

(10) Remove the return line/lines from the pump and plug the pump port/ports.

(11) Pour fresh fluid into the reservoir and check the draining fluid for contamination. If the fluid is still contaminated, disassemble and clean the steering gear and flush the system again.

(12) Install the return line/lines and perform Steering Pump Initial Operation, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

REMOVAL - GASOLINE ENGINE

(1) Remove the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) OR (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove the hoses from the power steering pump and cap the fittings.

(3) Remove battery ground cable and unthread stud from cylinder head, do not remove from bracket.

(4) Loosen upper bracket bolt and remove the lower bracket to engine block bolts.

(5) Pivot the pump assembly past the coolant tube.

(6) Remove the upper stud and remove upper bolt from cylinder head.

(7) Remove steering pump and mounting bracket from engine as an assembly.

(8) Remove the pump pulley with Puller C-4333, to access pump attaching bolts, (Refer to 19 - STEERING/PUMP/PULLEY - REMOVAL).

(9) Remove the front pump bracket (Fig. 3). On 8.0L engine remove rear pump bracket (Fig. 4).

REMOVAL - DIESEL ENGINE

(1) Remove and cap steering pump hoses and vacuum pump vacuum line.

(2) Remove the sender unit from engine block and plug hole in block (Fig. 5).

(3) Remove the serpentine belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove and cap the oil feed line from the bottom of the vacuum pump (Fig. 6).

(5) Remove the lower bolt that attaches the vacuum/steering pump assembly to the engine block. Remove the nut from the steering pump attaching bracket (Fig. 6).

(6) Remove upper bolt from the pump assembly (Fig. 7) and remove the assembly.

(7) Remove the mounting gasket.

(8) Remove the steering pump to vacuum pump bracket attaching nuts (Fig. 8).

(10) Remove the two pump body spacers.

INSTALLATION - GASOLINE ENGINE

(1) Install the front pump bracket and tighten bolts to 47 N·m (35 ft. lbs.). On 8.0L engine install rear pump bracket and tighten nut to 47 N·m (35 ft. lbs.), tighten bolts to 24 N·m (18 ft. lbs.).

(2) Install the pump pulley with Installer C-4063-B, (Refer to 19 - STEERING/PUMP/PULLEY - INSTALLATION).

(3) Install steering pump assembly on the engine block. Install the upper stud and bolt in bracket.

(4) Pivot the pump down past the coolant tube and install the lower bolts in bracket.

(5) Tighten the bolts and nut to 41 N·m (30 ft. lbs.).

(6) Connect the hoses to the pump.

(7) Install the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION), (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(8) Fill the reservoir with power steering fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - DIESEL ENGINE

(1) Install the two pump body spacers.

(2) Rotate the drive gear until the steering pump and vacuum pump drive dogs align. Install the steering pump onto the vacuum pump bracket. Use care to avoid damaging the oil seal in the vacuum pump during installation. **The steering pump housing and spacers must mate completely with the vacuum pump bracket.**

(3) Install the vacuum pump bracket to steering pump nuts and tighten to 24 N·m (18 ft. lbs.).

(4) Position new gasket on vacuum pump assembly. Use sealer if necessary to retain the gasket.

(5) Align and install the pump assembly on the engine. Ensure the steering pump stud is inserted into the block bracket. Tighten the pump-to-engine block attaching bolts to 77 N·m (57 ft. lbs.).

(6) Install the steering pump to attaching bracket nut and tighten to 24 N·m (18 ft. lbs.).

(7) Remove plug and install the oil pressure sending unit and electrical connector.

(8) Install the oil feed line to the vacuum pump. Tighten the oil line connection to 7 N·m (60 in. lbs./ 5 ft. lbs.).

(9) Install the fluid hoses to the power steering pump. Tighten the pressure fitting at the pump to 31 N·m (23 ft. lbs.).

(10) Install and clamp the hose on the vacuum pump.

(11) Install the serpentine belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Fill the reservoir with power steering fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(13) Start the engine and check the operation of the brakes.

- (4) With Serpentine Belts; Run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

HOSES - PRESSURE

DESCRIPTION

The hose consists of two metal ends and rubber center section that contains a tuning cable.

OPERATION

Power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the power steering gear.

HOSES - RETURN

DESCRIPTION

Power steering return line is a hose which is clamped at the pump and the gear.

OPERATION

Power steering return line, is used to transfer low pressure power steering fluid, from the power steering gear to the power steering pump.

LINKAGE - 2WD

DESCRIPTION

Light duty (LD) and heavy duty (HD) steering linkage is used with IFS suspensions. The linkage is comprised of a idler arm, pitman arm, center link and tie rod ends. Heavy duty linkage is used on 8800 and 10500 lb. GVW vehicles.

CAUTION: If any steering components are replaced or serviced an alignment must be performed.

NOTE: When servicing the steering linkage, use care to avoid damaging ball stud seals. Use Puller C-3894-A or an appropriate puller to remove tie rod ends (Fig. 1).

Fig. 1 Tie Rod End

- 1 - CLAMP
- 2 - ADJUSTMENT SLEEVE
- 3 - PULLER TOOL C-3894-A
- 4 - SEAL
- 5 - TIE-ROD END

STANDARD PROCEDURE - LUBRICATION

Periodic lubrication of the idler arm is required. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

REMOVAL

- (1) Remove the nut from the tie-rod.
- (2) Remove the tie-rod end ball studs from the steering knuckles with an appropriate puller.
- (3) Remove inner tie-rod ends from center link .
- (4) Remove idler arm stud from center link with an appropriate puller. Remove the idler arm bolt from frame bracket.
- (5) Remove pitman arm ball stud from center link.
- (6) Mark the pitman arm and shaft positions for installation reference. Remove pitman arm with Puller C-4150A (Fig. 2).

Fig. 2 Pitman Arm

- 1 - PITMAN ARM
- 2 - SPECIAL TOOL C-4150-A
- 3 - WRENCH

LINKAGE - 2WD (Continued)

INSTALLATION

(1) Position idler arm on the frame bracket and tighten the bolt to specification.

(2) Center steering gear to alignment marks and install pitman arm.

(3) Install the lock washer and retaining nut on the pitman shaft. Tighten the nut to 251 N·m (185 ft. lbs.).

(4) Install center link to ball studs and tighten retaining nuts to specification.

(5) Install tie-rod ends into center link and tighten the nuts to 88 N·m (65 ft. lbs.). Install new nuts.

(6) Install tie-rod ends into steering knuckles and tighten nuts to 108 N·m (80 ft. lbs.).

(7) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

(8) After adjustment, tighten the tie-rod adjustment sleeve clamp bolt to 61 N·m (45 ft. lbs.).

STANDARD PROCEDURE - LUBRICATION

Periodic lubrication of the steering system components is required. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

The following components must be lubricated:

- Tie rod
- Tie rod end
- Drag link

REMOVAL

- (1) Remove steering damper mounting nuts and bolts and remove damper.
- (2) Remove tie rod nuts.
- (3) Remove tie rod from drag link and left knuckle with Puller C-4150A.
- (4) Remove drag and nuts.
- (5) Remove drag link from right knuckle and pitman arm with Puller C-4150A.
- (6) Mark the pitman arm and shaft positions for installation reference. Remove the nut and washer from the pitman arm. Remove the pitman arm with Puller C-4150A.

LINKAGE - 4WD (Continued)

INSTALLATION

- (1) Align reference marks and install pitman arm.
- (2) Install the lock washer and retaining nut on the pitman shaft and tighten nut to 251 N·m (185 ft. lbs.).
- (3) Install drag link to the pitman arm. Install the nut and tighten to 108 N·m (80 ft. lbs.).
- (4) Install drag link to the right steering knuckle. Install the nut and tighten to 88 N·m (65 ft. lbs.).
- (5) Install tie rod to the left steering knuckle and drag link. Install the nuts and tighten to 108 N·m (80 ft. lbs.).

(6) Install steering damper on the axle. Tighten nut to 95 N·m (75 ft. lbs.).

(7) Install steering damper on the tie rod. Tighten nut to 81 N·m (60 ft. lbs.).

(8) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, refer to Group 2 Suspension.

(9) After adjustment tighten tie rod adjustment sleeve clamp bolts to 61 N·m (45 ft. lbs.).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

MANUAL - NV3500

DESCRIPTION

The NV3500 is a medium-duty 5-speed, constant mesh fully synchronized manual transmission. Fifth gear is an overdrive range with a ratio of 0.73:1. The NV3500 is available in two and four-wheel drive configurations.

The transmission gear case consists of two aluminum housings (Fig. 1). The clutch housing is not a removable component. It is an integral part of the transmission front housing.

A combination of roller and ball bearings are used to support the transmission shafts in the two housings. The transmission gears all rotate on caged type needle bearings. A roller bearing is used between the input and output shaft.

The transmission has a single shaft shift mechanism with three shift forks all mounted on the shaft. The shaft is supported in the front and rear housings by bushings and one linear ball bearing. Internal shift components consist of the forks, shaft, shift lever socket, and detent components

GEAR RATIOS

Gear ratios is as follows:

GEAR	RATIO
FIRST	4.02:1
SECOND	2.32:1
THIRD	1.40:1
FOURTH	1:1
FIFTH	0.73:1
REVERSE	3.55:1

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point, all the transmission gears are spinning.

MANUAL - NV3500 (Continued)

*Fig. 1 NV3500 Manual Transmission*

MANUAL - NV3500 (Continued)

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

DIAGNOSIS AND TESTING - MANUAL TRANSMISSION

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer.

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The con-

sequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Shift transmission into Neutral.
- (3) Remove shift boot bezel screws and slide boot upward on shift lever extension.
- (4) Remove shift lever extension from the shift tower and lever assembly.
- (5) Remove bolts attaching shift tower and lever assembly to rear case. Then remove shift tower and lever assembly.
- (6) Raise vehicle on hoist.
- (7) Remove crankshaft position sensor. Retain sensor attaching bolts.
- (8) Remove skid plate, if equipped.
- (9) Drain transmission lubricant if transmission will be disassembled for service.
- (10) Mark propeller shaft/shafts and yoke/yokes for installation reference and remove propeller shaft/shafts.
- (11) Disengage harness from clips on transmission housing.
- (12) Support engine with adjustable jack stand and wood block.
- (13) Drain transmission lubricant if transmission will be disassembled for service.

MANUAL - NV3500 (Continued)**TWO WHEEL DRIVE**

(1) Remove nuts attaching rear mount to crossmember (Fig. 2). Then remove insulator from extension housing if necessary.

(2) Remove bolts and nuts attaching crossmember to frame rails. Rotate crossmember diagonally and remove crossmember.

(3) Disconnect exhaust as necessary.

(4) Remove slave cylinder attaching nuts and remove cylinder from clutch housing.

(5) Remove starter motor.

(6) Support and secure transmission with safety chains to a transmission jack.

(7) Remove nuts/bolts attaching transmission front housing to engine.

(8) Remove transmission dust shield.

(9) Move transmission rearward until input shaft is clear of clutch disc and cover. Then lower jack and remove transmission from under vehicle.

FOUR WHEEL DRIVE

(1) Disconnect transfer case shift linkage at transfer case range lever.

(2) Remove bolts attaching shift linkage bracket to transfer case and move linkage and bracket aside.

(3) Support transfer case with transmission jack.

(4) Remove nuts attaching transfer case to transmission adapter housing.

(5) Remove transfer case with aid of helper.

(6) Support engine with a jack stand and a wood block.

(7) Remove nuts and bolts attaching support bracket and cushions to fixed crossmember.

(8) Remove nuts and bolts attaching removable crossmember to frame rails.

(9) Remove crossmember.

(10) Disconnect exhaust as necessary.

(11) Remove slave cylinder attaching nuts and remove cylinder from clutch housing. Move cylinder aside for working clearance.

(12) Remove clutch housing dust cover.

(13) On some models, it may be necessary to remove front axle struts and oil filter for access and removal clearance. Remove these components if necessary.

(14) Support transmission with transmission jack. Secure transmission to jack with safety chains.

(15) Remove bolts attaching transmission clutch housing to engine block.

(16) Move transmission rearward until transmission input shaft is clear of clutch disc and cover. Then lower jack and remove transmission from under vehicle.

J9509-126

Fig. 2 Transmission Rear Support Brackets

MANUAL - NV3500 (Continued)

DISASSEMBLY**FRONT HOUSING**

- (1) Shift transmission into Neutral.
- (2) If lubricant was not drained out of transmission during removal, remove drain plug and drain lubricant.
- (3) Inspect drain plug magnet for debris.
- (4) Remove backup light switch located on passenger side of rear housing (Fig. 3).

**Fig. 3 Backup Light Switch**

1 - BACKUP LIGHT SWITCH

- (5) Remove shift tower bolts and remove tower and lever assembly (Fig. 4).

**Fig. 4 Shift Tower**

1 - SHIFT TOWER AND LEVER ASSEMBLY
 2 - SHIFT SOCKET
 3 - SEAL

- (6) Remove shift shaft lock bolt (Fig. 5). Bolt is located at top of front housing just forward of shift tower. Bolt is a shoulder bolt that secures the shift shaft bushing and lever.

**Fig. 5 Shift Shaft Lock Bolt**

1 - SHIFT SHAFT LOCK BOLT
 2 - SHAFT SOCKET

- (7) Remove bolts attaching input shaft bearing retainer to front housing and remove retainer.

NOTE: Use pry tool to carefully lift retainer and break sealer bead (Fig. 6).

**Fig. 6 Loosening Bearing**

1 - PRY TOOL
 2 - INPUT SHAFT BEARING RETAINER

- (8) Remove bearing retainer from input shaft (Fig. 7).

- (9) Remove snap ring that secures input shaft in front bearing (Fig. 8).

MANUAL - NV3500 (Continued)

**Fig. 7 Input Shaft Bearing Retainer**

- 1 - SHAFT BEARING
- 2 - BEARING RETAINER
- 3 - INPUT SHAFT

**Fig. 8 Input Shaft**

- 1 - INPUT SHAFT SNAP RING
- 2 - OIL FEED

(10) Remove shift shaft detent plug with Remover 8117A. Attach fingers of the remover to the detent plug and push the cup down till it contacts the trans. Then tighten the nut till it pulls the plug from the case.

(11) Remove shift shaft detent plunger and spring with a pencil magnet.

(12) Remove bolts that attach front housing to rear housing (Fig. 9). Three bolts at extreme rear of housing are actually for the output shaft bearing retainer. It is not necessary to remove all three bolts at this time. Leave at least one bolt in place until geartrain is ready to be removed from case.

(13) Separate front housing from rear housing (Fig. 10). Use plastic hammer to tap front housing off alignment dowels.

(14) Remove and inspect input shaft bearing. Inspect countershaft front bearing race (Fig. 11).

- 9 - 3-4 FORK

SHIFT/FORK SHAFTS AND REVERSE IDLER SEGMENT

(1) Unseat shift socket roll pin with Remover 6858. Position remover on shift shaft and center tool over the roll pin. Verify tool legs are firmly seated on the shift socket (Fig. 13).

(2) Tilt socket toward the side of the case to avoid trapping the pin between the gear teeth.

(3) Tighten remover to press the roll pin downward and out of the shift socket (Fig. 13).

NOTE: Roll pin does not have to be completely removed, the pin must only be clear of the shift shaft. Be careful not to push the pin into the geartrain.

Fig. 13 Shift Socket

- 1 - REMOVER 6858
- 2 - SHIFT SOCKET

(4) Drive out shift bushing and lever roll pint with a hammer and punch (Fig. 14).

NOTE: Use proper size punch to avoid bending the shift shaft.

(5) Pull shift shaft straight out of rear housing, shift socket, fifth-reverse fork and 1-2 fork (Fig. 15).

(6) Remove shift socket from rear housing (Fig. 16).

(7) Remove lever and bushing (Fig. 17).

(8) Remove 3-4 fork. Rotate 3-4 fork around synchro sleeve until fork clears shift arms on 1-2 and fifth-reverse forks. Then remove 3-4 fork (Fig. 18).

MANUAL - NV3500 (Continued)

- 3 - 3-4 SYNCHRO SLEEVE

(9) Remove the reverse idler shaft support bolt (front bolt) (Fig. 19).

(10) Loosen rear reverse idler shaft bolt (rear bolt) (Fig. 19).

(11) Remove reverse idler shaft support segment by sliding it straight out of housing.

(12) Support geartrain and rear housing on Fixture 6747 as follows:

(a) Adjust height of reverse idler pedestal rod until the reverse idle shaft bottoms in Cup 8115.

(b) Position Adapters 6747-1A and 6747-2B on Fixture 6747.

(c) Slide fixture tool onto input shaft, countershaft and idler gear (Fig. 20).

(d) Stand geartrain and rear housing upright on fixture (Fig. 21). Have helper hold fixture tool in place while housing and geartrain is being rotated into upright position.

MANUAL - NV3500 (Continued)

GEARTRAIN FROM FIXTURE

- (1) Remove reverse idler gear assembly from assembly fixture cup.
- (2) Remove 1-2 and fifth-reverse forks from synchro sleeves.
- (3) Slide countershaft out of fixture tool.
- (4) Remove output shaft bearing retainer from rear surface of fifth gear (retainer will drop onto gear after bolts are removed).
- (5) Lift and remove output shaft and gears off input shaft.
- (6) Lift and remove input shaft, pilot bearing and fourth gear synchro ring from assembly fixture tool.

OUTPUT SHAFT

NOTE: The synchronizer hubs and sleeves are different and must not be intermixed. Remove each synchronizer unit as an assembly to avoid intermixing parts. Mark each synchro hub and sleeve with a scribe or paint for correct assembly reference.

(1) Remove snap ring that secures 3-4 synchro hub on output shaft.

(2) Remove 3-4 synchro assembly, third gear synchro ring and third gear with shop press and Bearing Splitter 1130. Position splitter between second and third gears.

(3) Remove third gear needle bearing (Fig. 31).

80a9b3b7

Fig. 31 Third Gear Needle Bearing

Fig. 43 Reverse Gear And Needle Bearing

- 1 - REVERSE GEAR AND NEEDLE BEARING

REVERSE IDLER

- (1) Remove idler gear snap rings (Fig. 44).
- (2) Remove thrust washer, wave washer, thrust plate and idler gear from shaft.
- (3) Remove idler gear needle bearing from shaft.

CLEANING

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean the shaft bearings with a mild solvent such as Mopar® degreasing solvent, Gunk, or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry, or wipe them dry with clean shop towels.

INSPECTION**SHIFT LEVER ASSEMBLY**

The shift lever assembly is not serviceable. Replace the lever and shift tower as an assembly if the tower, lever, lever ball, or internal components are worn, or damaged.

SHIFT SHAFT AND FORKS

Inspect the shift fork interlock arms and synchro sleeve contact surfaces (Fig. 45). Replace any fork exhibiting wear or damage in these areas. Do not attempt to salvage shift forks.

Check condition of the shift shaft detent plunger and spring. The plunger should be smooth and free of nicks, or scores. The plunger spring should be straight and not collapsed, or distorted. Minor scratches, or nicks on the plunger can be smoothed with 320/400 grit emery soaked in oil. Replace the plunger and spring if in doubt about condition. Check condition of detent plunger bushings. Replace if damaged.

Inspect the shift shaft, shift shaft bushing and bearing, the shaft lever, and the lever bushing that fits over the lever. Replace the shaft if bent, cracked, or severely scored. Minor burrs, nicks, or scratches can be smoothed off with 320/400 grit emery cloth followed by polishing with crocus cloth. Replace the shift shaft bushing or bearing if damaged.

Replace the shaft lever and bushing if either part is deformed, or worn. Do not attempt to salvage these parts as shift fork binding will occur. Replace the roll pin that secures the lever to the shaft.

FRONT/REAR HOUSINGS AND BEARING RETAINERS

Inspect the housings carefully. Look for cracks, stripped threads, scored mating surfaces, damaged bearing bores, or worn dowel pin holes. Minor nicks on mating surfaces can be dressed off with a fine file, or emery cloth. Damaged threads can be renewed by either re-tapping or installing Helicoil inserts.

- 3 - SHAFT LEVER BUSHING

- 4 - 3-4 SHIFT FORK
- 5 - 1-2 SHIFT FORK
- 6 - FIFTH-REVERSE SHIFT FORK

NOTE: The front housing contains the countershaft front bearing race. The rear housing contains the countershaft rear bearing race. Be advised that these components are NOT serviceable items. The front housing will have to be replaced if the coun-

tershaft bearing race is loose, worn, or damaged. The rear housing will have to be replaced if the countershaft rear bearing race is loose, worn, or damaged.

MANUAL - NV3500 (Continued)

Inspect the input shaft bearing retainer. Be sure the release bearing slide surface of the retainer is in good condition. Minor nicks on the surface can be smoothed off with 320/420 grit emery cloth and final polished with oil coated crocus cloth. Replace the retainer seal if necessary.

Inspect the output shaft bearing retainer. Be sure the U-shaped retainer is flat and free of distortion. Replace the retainer if the threads are damaged, or if the retainer is bent, or cracked.

COUNTERSHAFT BEARINGS AND RACES

The countershaft bearings and races are machine lapped during manufacture to form matched sets. The bearings and races should not be interchanged.

NOTE: The bearing races are a permanent press fit in the housings and are NOT serviceable. If a bearing race becomes damaged, it will be necessary to replace the front or rear housing as necessary. A new countershaft bearing will be supplied with each new housing for service use.

The countershaft bearings can be installed backwards if care is not exercised. The bearing roller cage is a different diameter on each side. Be sure the bearing is installed so the large diameter side of the cage is facing the countershaft gear (Fig. 46). The small diameter side goes in the bearing race.

J9421-55

Fig. 46 Countershaft Bearings

- 1 - COUNTERSHAFT
2 - BEARING CAGE

REVERSE IDLER COMPONENTS

Inspect the idler gear, bearing, shaft, thrust washer, wave washer and thrust plate. Replace the bearing if any of the needle bearing rollers are worn, chipped, cracked, flat-spotted, or brinnelled. Also replace the bearing if the plastic bearing cage is damaged or distorted.

Replace the thrust washer, wave washer, or thrust plate if cracked, chipped, or worn. Replace the idler gear if the teeth are chipped, cracked or worn thin. Replace the shaft if worn, scored, or the bolt threads are damaged beyond repair. Replace the support segment if cracked, or chipped and replace the idler attaching bolts if the threads are damaged.

Shift Socket

Inspect the shift socket for wear or damage. replace the socket if the roll pin, or shift shaft bores are damaged. Minor nicks in the shift lever ball seat in the socket can be smoothed down with 400 grit emery or wet/dry paper. Replace the socket if the ball seat is worn, or cracked. Do not reuse the original shift socket roll pin. Install a new pin during reassembly. The socket roll pin is approximately 33 mm (1-1/4 in.) long.

Output Shaft And Geartrain

Inspect all of the gears for worn, cracked, chipped, or broken teeth. Also check condition of the bearing bore in each gear. The bores should be smooth and free of surface damage. Discoloration of the gear bores is a normal occurrence and is not a reason for replacement. Replace gears only when tooth damage has occurred, or if the bores are brinnelled or severely scored.

Inspect the shaft splines and bearings surfaces. Minor nicks on the bearing surfaces can be smoothed with 320/420 grit emery and final polished with crocus cloth. Replace the shaft if the splines are damaged or bearing surfaces are deeply scored, worn, or brinnelled.

ASSEMBLY

Gaskets are not used in this transmission. Sealers are used at all case joints. Recommended sealers are Mopar Gasket Maker for all case joints and Mopar silicone sealer, or equivalent, for the input shaft bearing retainer. Apply these products as indicated in the assembly procedures.

NOTE: The transmission shift components must be in Neutral position during assembly. This prevents damaging to the synchro and shift components when the housings are installed.

MANUAL - NV3500 (Continued)

The 3-4, 1-2 and fifth-reverse synchro hub snap rings can be fitted selectively. New snap rings are available in 0.05 mm (0.0019 in.) thickness increments. Use thickest snap ring that will fit in each snap ring groove.

SYNCHRONIZER

To assemble each synchro install the springs, struts and detent balls one at a time as follows:

(1) Slide sleeve part way onto the hub. Leave enough room to install the spring in the hub and the strut in the hub groove.

(2) Install first spring in the hub, then install a strut over the spring. Verify spring is seated in the spring bore in the strut.

(3) Slide sleeve onto the hub just far enough to hold the first strut and spring in place.

(4) Place detent ball in the top of the strut, then carefully work the sleeve over the ball to hold it in place. A small flat blade screwdriver can be used to press the ball into place while moving the sleeve over it.

(5) Repeat procedure for the remaining springs, struts and balls. Tape or a rubber band can be used to temporarily secure each strut and ball as they are installed.

(6) Verify the synchro three springs, struts and detent balls are all in place (Fig. 47).

J9421-57

- 5 - DETENT BALL (3)
- 6 - HUB

OUTPUT SHAFT

NOTE: Lubricate shaft, gears and bearings with recommended lubricant during assembly. Petroleum jelly can be used to hold parts in place. Immerse each synchro ring in lubricant before installation.

(1) Lubricate and install reverse gear needle bearing on shaft (Fig. 48). Slide bearing up against shoulder on output shaft.

J9421-58

Fig. 48 Reverse Gear Bearing

- 1 - REVERSE GEAR BEARING
- 2 - SHOULDER

(2) Install reverse gear over needle bearing (Fig. 49).

J9421-59

Fig. 49 Reverse Gear

- 1 - REVERSE GEAR

(3) Install brass synchro ring on reverse gear (Fig. 50).

(4) Assemble fifth-reverse synchro hub, sleeve, struts, springs and detent balls, if not previously done.

CAUTION: One side of the hub has shoulders around the hub bore, this side of the hub faces the front of the shaft. One side of the sleeve is tapered the tapered side faces the front of the shaft.

MANUAL - NV3500 (Continued)

**Fig. 50 Reverse Gear Synchro**

- 1 - REVERSE GEAR
2 - SYNCHRO RING

(5) Start fifth-reverse synchro assembly on output shaft splines by hand. Then seat synchro onto shaft with shop press and Remover 6310-1 (Fig. 51).

**Fig. 51 Fifth-Reverse Synchro Assembly**

2 - PRESS RAM
3 - REVERSE GEAR
4 - FIFTH-REVERSE SYNCHRO ASSEMBLY
5 - REMOVER 6310-1
6 - PRESS BLOCKS
7 - OUTPUT SHAFT

(6) Install the thickest **new** fifth-reverse hub snap ring (Fig. 52) that will fit in shaft groove. Verify snap ring is seated in the groove.

NOTE: Snap rings are available in thicknesses from 2.00 mm to 2.20 mm (0.078 to 0.086 in.).

**Fig. 52 Fifth-Reverse Synchro Hub Snap Ring**

- 1 - FIFTH-REVERSE SYNCHRO ASSEMBLY
2 - SNAP RING
3 - PRESS BED
4 - PRESS BLOCKS

(7) Install fifth gear synchro ring in synchro hub and sleeve (Fig. 53).

**Fig. 53 Fifth Gear Synchro Ring**

- 1 - FIFTH-SPEED SYNCHRO RING
2 - FIFTH-REVERSE SYNCHRO ASSEMBLY

MANUAL - NV3500 (Continued)

(8) Install fifth gear bearing. Spread bearing only enough to clear shoulder on output shaft (Fig. 54). Verify bearing is properly seated.

Fig. 54 Fifth Gear Bearing

- 1 - SHAFT SHOULDER
- 2 - FIFTH GEAR BEARING

(9) Install fifth gear on shaft and onto bearing (Fig. 55).

Fig. 55 Fifth Gear

- 1 - FIFTH GEAR
- 2 - BEARING

(10) Invert output shaft and set the shaft in Special Tool 6310-1 so that fifth gear is seated on the tool (Fig. 56).

(11) Install first gear bearing on output shaft (Fig. 56). Verify bearing is seated on shaft shoulder and is properly joined.

Fig. 56 First Gear

- 1 - FIRST GEAR BEARING
- 2 - SHAFT SHOULDER
- 3 - SPECIAL TOOL 6310-1
- 4 - PRESS BLOCKS

(12) Install first gear on shaft and over bearing (Fig. 57). Verify bearing synchro cone is facing up as shown.

Fig. 57 First Gear

- 1 - FIRST GEAR
- 2 - SPECIAL TOOL 6310-1
- 3 - BEARING

MANUAL - NV3500 (Continued)

(13) Install first gear synchro ring (Fig. 58).

Fig. 58 First Gear Synchro Ring

- 1 - FIRST GEAR SYNCHRO RING
- 2 - SPECIAL TOOL 6310-1
- 3 - FIRST GEAR

(14) Assemble 1-2 synchro hub sleeve, springs, struts and detent balls.

CAUTION: One side of the synchro sleeve is marked First Gear Side. This side of the sleeve must face first gear after installation.

(15) Start 1-2 synchro assembly on shaft by hand (Fig. 59). Verify synchro sleeve is properly positioned.

Fig. 59 Starting 1-2 Synchro

- 1 - 1-2 SYNCHRO ASSEMBLY
- 2 - SPECIAL TOOL 6310-1
- 3 - FIRST GEAR SIDE

(16) Press 1-2 synchro onto output shaft using suitable size pipe and shop press (Fig. 60).

CAUTION: Carefully align the synchro ring and sleeve as hub the is being pressed onto the shaft. The synchro ring can be cracked if it becomes misaligned.

Fig. 60 Press 1-2 Synchro On Output Shaft

- 1 - PIPE TOOL
- 2 - SYNCHRO RING
- 3 - SPECIAL TOOL 6310-1
- 4 - 1-2 SYNCHRO ASSEMBLY
- 5 - PRESS RAM

(17) Install interm ring.

(18) Install thickest **new** 1-2 synchro hub snap ring (Fig. 61) that will fit in shaft groove. Verify snap ring is seated in shaft groove.

NOTE: Snap rings are available in thicknesses from 1.80 mm to 2.00 mm (0.070 to 0.078 in.).

(19) Install second gear synchro ring in 1-2 synchro hub and sleeve (Fig. 62). Verify synchro ring is seated in sleeve.

(20) Install synchro friction cone and synchro cone in synchro ring.

MANUAL - NV3500 (Continued)**Fig. 61 1-2 Synchro Hub Snap Ring**

- 1 - 1-2 SYNCHRO
- 2 - SPECIAL TOOL 6310-1

(26) Install third gear needle bearing on shaft (Fig. 68).

Fig. 68 Third Gear Bearing

1 - THIRD GEAR BEARING

(27) Install third gear on shaft and bearing (Fig. 69).

Fig. 69 Third Gear

1 - THIRD GEAR
2 - BEARING

(28) Install third speed synchro ring on third gear (Fig. 70).

(29) Assemble 3-4 synchro hub, sleeve, springs, struts and detent balls.

Fig. 70 Third Gear Synchro Ring

1 - THIRD SPEED SYNCHRO RING
2 - THIRD GEAR

CAUTION: The 3-4 synchro hub and sleeve can be installed backwards if care is not exercised. One side of the sleeve has grooves in it, this side of sleeve faces the front of the shaft.

(30) Start 3-4 synchro hub on output shaft splines by hand (Fig. 71).

Fig. 71 3-4 Synchro Hub On Output Shaft

1 - GROOVED SIDE OF SLEEVE
2 - 3-4 SYNCHRO ASSEMBLY

MANUAL - NV3500 (Continued)

(31) Press 3-4 synchro assembly onto output shaft with shop press and suitable size pipe (Fig. 72). Verify tool presses on hub as close to output shaft as possible but does not contact the shaft splines.

Fig. 72 Press 3-4 Synchro On Output Shaft

- 1 - PRESS RAM
- 2 - PIPE TOOL
- 3 - 3-4 SYNCHRO
- 4 - THIRD SPEED SYNCHRO RING

(32) Install thickest **new** 3-4 synchro hub snap ring (Fig. 73) that will fit in shaft groove. Verify snap ring is seated in groove.

NOTE: Snap rings are available in thicknesses from 2.00 - 2.30 mm (0.078 - 0.090 in.).

Fig. 73 3-4 Synchro Hub Snap Ring

- 1 - 3-4 SYNCHRO HUB SNAP RING
- 2 - HEAVY DUTY SNAP RING PLIERS

(33) Install output shaft bearing.

(34) Install output shaft bearing snap ring with heavy duty snap ring pliers (Fig. 74). Verify snap ring is seated in shaft groove.

NOTE: Spread snap ring only enough to install it.

Fig. 74 Output Shaft Bearing Snap

- 1 - BEARING SNAP RING
- 2 - HEAVY DUTY SNAP RING PLIERS

(35) Verify position of synchro sleeves before proceeding (Fig. 75). Grooved side of 3-4 sleeve must be facing forward. First gear side of 1-2 sleeve must be facing first gear. Tapered side of fifth-reverse sleeve must be facing forward.

REVERSE IDLER ASSEMBLY

- (1) Lubricate idler components with gear lube.
- (2) Slide idler gear bearing on shaft (Fig. 76). Bearing fits either way on shaft.
- (3) Slide gear onto shaft. Side of gear with recess goes to rear (Fig. 76).
- (4) Place first lock ball in dimple at rear end of idler shaft (Fig. 76). Petroleum jelly can be used to hold ball in place if desired.
- (5) Slide thrust rear thrust washer onto shaft and over lock ball (Fig. 77).
- (6) Install snap ring in groove at rear of shaft (Fig. 77).
- (7) Install lock ball in dimple at front of shaft. Hold ball in place with petroleum jelly if desired.

SHIFT SHAFT AND DETENT PLUNGER BUSHINGS/BEARINGS

(1) Inspect shift shaft bushing and bearing for damage.

(2) If necessary, the shift shaft bushing can be replaced as follows:

(a) Locate a bolt that will thread into the bushing without great effort.

(b) Thread the bolt into the bushing, allowing the bolt to make its own threads in the bushing.

(c) Attach a slide hammer or suitable puller to the bolt and remove bushing.

(d) Use the short end of Installer 8119 to install the new bushing.

(e) Bushing is correctly installed if flush with the transmission case.

(3) If necessary, the shift shaft bearing can be replaced as follows:

(a) Locate a bolt that will thread into the bearing without great effort.

(b) Thread the bolt into the bearing as much as possible.

(c) Attach a slide hammer or suitable puller to the bolt and remove the bearing.

(d) Use the short end of Installer 8119 to install the new bearing.

(e) Bearing is correctly installed if flush with the transmission case.

(4) Inspect detent plunger bushings for damage.

NOTE: The detent plunger bushings are installed to a specific depth. The space between the two bushings when correctly installed contain an oil feed hole. Do not attempt to install the bushings with anything other than the specified tool or this oil hole may become restricted.

(5) If necessary, the detent plunger bushings can be replaced as follows:

(a) Using the long end of Installer 8119, drive the detent bushings through the outer case and into the shift shaft bore.

(b) Remove the bushings from the shift shaft bore.

(c) Install a new detent plunger bushing on the long end of Installer 8118.

(d) Start bushing in the detent plunger bore in the case.

(e) Drive bushing into the bore until the tool contacts the transmission case.

(f) Install a new detent plunger bushing on the short end of Installer 8118.

(g) Start the bushing in the detent plunger bore in the case.

(h) Drive bushing into the bore until the tool contacts the transmission case.

GEARTRAIN ASSEMBLY

(1) Install Adapter 6747-1A on input shaft hub of Fixture 6747 (Fig. 79). Then install Adapter 6747-2B on front bearing hub of countershaft. Be sure the shoulder is seated against the countershaft.

(2) Install input shaft in fixture tool. Make sure Adapter Tool 6747-1A is positioned under shaft as shown (Fig. 80).

(3) Install pilot bearing in input shaft (Fig. 80).

NOTE: The side of the pilot bearing with the small diameter goes toward the input shaft.

MANUAL - NV3500 (Continued)**Fig. 79 Fixture For Geartrain Build-up**

- 1 - ADAPTER 6747-2B
- 2 - CUP 8115
- 3 - ADAPTER 6747-1A
- 4 - FIXTURE 6747

**Fig. 80 Pilot Bearing And Input Shaft**

- 1 - PILOT BEARING
- 2 - INPUT SHAFT

(4) Install fourth gear synchro ring on input shaft (Fig. 81).

**Fig. 81 Fourth Gear Synchro**

- 1 - FOURTH GEAR SYNCHRO RING
- 2 - INPUT SHAFT

(5) Adjust height of idler gear pedestal on assembly fixture (Fig. 82). Start with a basic height of 18.4 cm (7-1/4 in.). Final adjustment can be made after gear is positioned on pedestal.

**Fig. 82 Idler Pedestal Base Height**

- 1 - REVERSE IDLER PEDESTAL

MANUAL - NV3500 (Continued)

(6) Install assembled output shaft and geartrain in input shaft (Fig. 83). Carefully rotate output shaft until the 3-4 synchro ring seats in synchro hub and sleeve.

Fig. 83 Output Shaft And Geartrain Installed In Input

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - INPUT SHAFT
- 3 - FIXTURE 6747

(7) Install Adapter 6747-2B on front bearing hub of countershaft, if not previously done. The shoulder goes toward the countershaft.

(8) Slide countershaft (and adapter) into fixture slot. Verify countershaft and output shaft gears are fully meshed with the mainshaft gears before proceeding (Fig. 84).

(9) Check alignment of countershaft and output shaft gear teeth. Gears may not align perfectly a difference in height of 1.57 to 3.18 mm (1/16 to 1/8 in.) will probably exist. This difference will not interfere with assembly. If difference is greater than this, the countershaft adapter tool is probably upside down. Remove countershaft, reverse adapter tool, reinstall countershaft and check alignment again.

Fig. 84 Countershaft On Fixture Tool

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT (SLIDE INTO PLACE ON FIXTURE TOOL)

(10) Position reverse idler in support cup of assembly fixture (Fig. 85). Verify idler gear is properly meshed and aligned with shaft gear teeth and that bolt holes are facing out from the geartrain. Adjust pedestal up or down if necessary and verify short end of idler shaft is facing up as shown.

MANUAL - NV3500 (Continued)

Fig. 85 Reverse Idler Assembly On Assembly Fixture Tool

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT
- 3 - REVERSE IDLER ASSEMBLY
- 4 - TOOL PEDESTAL

(11) On 2-wheel drive transmission, thread one Alignment Pin 8120 in center or passenger side hole of output shaft bearing retainer. Then position retainer on fifth gear as shown (Fig. 86).

Fig. 86 Positioning Output Shaft Bearing Retainer

- 1 - PIN 8120
- 2 - OUTPUT SHAFT BEARING RETAINER

(12) Assemble 1-2 and fifth reverse-shift forks (Fig. 87). Arm of fifth-reverse fork goes through slot in 1-2 fork.

Fig. 87 1-2 And Fifth-Reverse Shift Forks

- 1 - INSERT ARM THROUGH 1-2 FORK
- 2 - 1-2 FORK
- 3 - FIFTH-REVERSE FORK

(13) Install assembled shift forks in synchro sleeves and verify forks are seated in sleeves (Fig. 88).

Fig. 88 Shift Forks In Synchro

- 1 - SYNCHRO SLEEVES
- 2 - FORK ARMS
- 3 - SHIFT FORKS

MANUAL - NV3500 (Continued)

REAR HOUSING - 2WD

(1) Drive adapter housing alignment dowels back into housing until dowels are flush with mounting surface (Fig. 89).

J9421-101

Fig. 89 Rear Housing Dowels

- 1 - HOUSING ALIGNMENT DOWELS
- 2 - REAR HOUSING
- 3 - DOWEL FLUSH WITH SURFACE

(2) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(3) Install countershaft rear bearing in bearing race (Fig. 90).

NOTE: Large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 91).

(4) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(5) Apply light coat of petroleum jelly to shift shaft bushing/bearing in rear housing (Fig. 91).

(6) Reach into countershaft rear bearing with finger and push each bearing roller outward against the race. Then apply extra petroleum jelly to hold rollers in place during housing installation.

Fig. 91 Countershaft Bearing

- 1 - SHIFT SHAFT BUSHING/BEARING
- 2 - COUNTERSHAFT REAR BEARING (SEATED IN RACE)

MANUAL - NV3500 (Continued)

(7) Install rear housing onto geartrain (Fig. 92) and verify bearing retainer pilot stud is in correct bolt hole in housing. Be sure countershaft and output shaft bearings are aligned in housing and on countershaft.

NOTE: It may be necessary to lift upward on countershaft slightly to ensure that the countershaft rear bearing engages to the countershaft before the rear output shaft bearing engages the housing.

Fig. 92 Rear Housing - 2WD

- 1 - REAR HOUSING
- 2 - SHIFT FORKS AND GEARTRAIN

(8) Seat rear housing on output shaft rear bearing and countershaft. Use plastic or rawhide mallet to tap housing into place.

(9) Apply Mopar Gasket Maker or equivalent to housing bolt threads, bolt shanks and under bolt heads (Fig. 93).

(10) Start first two bolts in retainer (Fig. 94). It may be necessary to move retainer rearward (with pilot stud) in order to start bolts in retainer.

(11) Remove Alignment Pin 8120 and install last retainer bolt (Fig. 94).

(12) Tighten all three retainer bolts to 30-35 N·m (22-26 ft. lbs.).

Fig. 93 Housing Bolts

- 1 - MOPAR GASKET MAKER (OR LOCTITE 518)

- 5 - REAR BEARING

(3) Apply Mopar Gasket Maker or equivalent to threads, bolt shanks and under hex heads of bearing retainer bolts (Fig. 93).

(4) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(5) Install countershaft rear bearing in bearing race (Fig. 91).

NOTE: Large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 91).

(6) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(7) Apply light coat of petroleum jelly to shift shaft bushing/bearing in adapter housing (Fig. 91).

(8) Install adapter housing on geartrain.

(9) Install rear bearing snap ring on output shaft (Fig. 96).

(10) Lubricate lip of new rear seal (Fig. 97) with Mopar® Door Ease, or transmission fluid.

(11) Install **new** rear seal in adapter housing bore with Installer C-3860-A. Verify seal is seated in housing bore (Fig. 97).

J9421-201

SHIFT SHAFT, SHAFT LEVER AND BUSHING AND SHIFT SOCKET

(1) Verify that all synchro sleeves are in Neutral position (centered on hub).

CAUTION: Transmission synchros must all be in Neutral position for reassembly. Otherwise the housings, shift forks and gears can be damaged during installation of the two housings.

MANUAL - NV3500 (Continued)

(2) Install 3-4 shift fork in synchro sleeve (Fig. 98). Verify groove in fork arm is aligned with grooves in 1-2 and fifth-reverse fork arms as shown.

Fig. 98 3-4 Shift Fork

- 1 - 3-4 FORK
- 2 - ALIGN GROOVES IN FORK ARMS

(3) Slide shift shaft through 3-4 shift fork (Fig. 99) with shaft detent notches to the rear.

Fig. 99 Shift Shaft

- 1 - SHIFT SHAFT
- 2 - 3-4 FORK
- 3 - SHAFT DETENT NOTCHES

(4) Assemble shift shaft shift lever and bushing (Fig. 100). Verify slot in bushing is facing up and roll pin hole for lever is aligned with hole in shaft.

(5) Install assembled lever and bushing on shift shaft (Fig. 101).

Fig. 100 Shift Shaft Lever And Bushing

- 1 - SHAFT LEVER
- 2 - LEVER BUSHING
- 3 - BUSHING LOCK PIN SLOT

Fig. 101 Install Shift Shaft Lever And Bushing

- 1 - SHIFT SHAFT
- 2 - SHAFT LEVER AND BUSHING
- 3 - 3-4 FORK

(6) Slide shift shaft through 1-2 and fifth-reverse fork and into shift lever opening in rear housing (Fig. 102).

(7) Align shift socket with shaft and slide shaft through socket and into shift shaft bearing in rear housing (Fig. 103).

(8) Rotate shift shaft so detent notches in shaft are facing the TOP of the transmission housing.

MANUAL - NV3500 (Continued)

**Fig. 102 Inserting Shaft Into Lever Opening**

1 - SHIFT SHAFT

**Fig. 103 Shift Socket**1 - SHIFT SOCKET
2 - SHIFT SHAFT

CAUTION: Both shaft roll pins can be installed when the shaft is 180° off. If this occurs, the transmission will have to be disassembled again to correct shaft alignment.

(9) Select correct **new** roll pin for shift shaft lever (Fig. 104). Shaft lever roll pin is approximately 22 mm (7/8 in.) long. Shift socket roll pin is approximately 33 mm (1-1/4 in.) long.

(10) Align roll pin holes in shift shaft, lever and bushing. Then start roll pin into shaft lever by hand (Fig. 105).

J9421-86

Fig. 104 Roll Pin Identification1 - SHAFT LEVER ROLL PIN
2 - SHIFT SOCKET ROLL PIN**Fig. 105 Roll Pin In Shift Socket**1 - SHAFT LEVER ROLL PIN
2 - LEVER AND BUSHING

(11) Seat shaft lever roll pin with pin punch (Fig. 106).

CAUTION: Shaft lever roll pin must be flush with the surface of the lever. The lever bushing will bind on the roll pin if the pin is not seated flush.

(12) Verify that lock pin slot in lever bushing is positioned as shown (Fig. 106).

(13) Align roll pin holes in shift socket and shift shaft. Then start roll pin into shift shaft by hand (Fig. 107).

(14) Seat roll pin in shift socket with pin punch. Roll pin must be flush with socket after installation (Fig. 108).

(15) Verify that notches in shift fork arms are aligned. Realign arms if necessary.

**Fig. 106 Shift Shaft Lever Roll**

- 2 - COUNTERSHAFT FRONT BEARING
- 3 - SHIFT SHAFT BUSHING

(3) Reach into countershaft front bearing with finger and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place during housing installation.

(4) Apply small amount of petroleum jelly to shift shaft bushing in front housing.

MANUAL - NV3500 (Continued)

**Fig. 110 Countershaft Front Bearing**

- 1 - BEARING RACE
- 2 - PETROLEUM JELLY
- 3 - COUNTERSHAFT FRONT BEARING

(5) Apply 1/8 in. wide bead of Mopar® Gasket Maker or equivalent to mating surfaces of front and rear housings (Fig. 111).

**Fig. 111 Seal Front/Rear Housings**

- 1 - HOUSING FLANGE SURFACE
- 2 - MOPAR GASKET MAKER (OR LOCTITE 518)

(6) Have helper hold rear housing and geartrain in upright position. Then install front housing on rear housing and geartrain.

(7) Work front housing downward onto geartrain until seated on rear housing.

CAUTION: Front housings will not seat if shift components are not in Neutral or one or more components are misaligned. Do not force the front housing into place.

(8) Tap rear housing alignment dowels back into place with hammer and pin punch. Both dowels should be flush fit in each housing. Have helper hold transmission upright while dowels are tapped back into place.

(9) Place transmission in horizontal position.

(10) Apply Mopar® Gasket Maker or equivalent, to housing attaching bolts. Apply sealer material sealer to underside of bolt heads and to bolt shanks and threads (Fig. 112).

(11) Install and start housing attaching bolts by hand (Fig. 112). Then tighten bolts to 34 N·m (25 ft. lbs.).

**Fig. 112 Housing Bolts**

- 1 - HOUSING ATTACHING BOLTS (APPLY SEALER BEFOREHAND)

(12) Install shift shaft bushing lock bolt (Fig. 113). Apply Mopar Gasket Maker or equivalent to bolt threads, shank and underside of bolt head before installation.

CAUTION: If lock bolt cannot be fully installed the shift shaft is not in Neutral, or the shaft bushing (or lever) is misaligned.

(13) Lubricate then install shift shaft detent plunger in housing bore (Fig. 114). Lubricate plunger with petroleum jelly or gear lubricant. Verify plunger is fully seated in detent notch in shift shaft.

(14) Install detent spring inside plunger (Fig. 114).

(15) Install detent plug in end of Installer 8123. Position plug on detent spring and compress spring until detent plug pilots in detent plunger bore. Drive detent plug into transmission case until plug seats.

(16) Install backup light switch (Fig. 115).

MANUAL - NV3500 (Continued)

(17) Install input shaft snap ring (Fig. 116).

**Fig. 116 Shaft Snap Ring - Typical**

- 1 - INPUT SHAFT SNAP RING

(18) Install **new** oil seal in front bearing retainer with Installer 6448 (Fig. 117).

**Fig. 117 Oil Seal In Front Bearing Retainer**

- 1 - INSTALLER 6448
2 - FRONT BEARING RETAINER

(19) Apply bead of Mopar silicone sealer or equivalent to flange surface of front bearing retainer (Fig. 118).

(20) Align and install front bearing retainer over input shaft and onto housing mounting surface (Fig. 119). Verify bolt holes are aligned before seating retainer.

CAUTION: Be sure sealer does not get into the oil feed hole in the transmission case or bearing retainer.

MANUAL - NV3500 (Continued)

(21) Install and tighten bearing retainer bolts to 7-10 N·m (5-7 ft. lbs.) (Fig. 120).

80a9b3ae

Fig. 120 Input Shaft Bearing Retainer Bolts - Typical

- 1 - RETAINER BOLTS

SHIFT TOWER AND LEVER

- (1) Apply petroleum jelly to ball end of shift lever and interior of shift socket.
- (2) Shift the transmission into third gear.
- (3) Align and install shift tower and lever assembly (Fig. 121). Be sure shift ball is seated in socket and the offset in the tower is toward the passenger side of the vehicle before installing tower bolts.
- (4) Install shift tower bolts (Fig. 122) and tighten bolts to 8.5 N·m (75.2 in. lbs.).

80a726fb

Fig. 121 Shift Tower

- 1 - SHIFT TOWER

MANUAL - NV3500 (Continued)

**Fig. 122 Shift Tower Bolts**

1 - SHIFT TOWER AND LEVER ASSEMBLY

(5) Fill transmission to bottom edge of fill plug hole with Mopar Transmission Lubricant.

(6) Install and tighten fill plug to 34 N·m (25 ft. lbs.).

(7) Check transmission vent. Be sure vent is open and not restricted.

INSTALLATION

NOTE: If a new transmission is being installed, be sure to use all components supplied with the new transmission. For example, if a new shift tower is supplied with the new transmission, do not re-use the original shift tower.

Make sure transmission front housing mounting surface is clean. Before installation apply light coat of Mopar high temperature bearing grease to contact surfaces of following components:

- input shaft splines.
- release bearing slide surface of front retainer.
- release bearing bore.
- release fork.
- release fork ball stud.
- propeller shaft slip yoke.

(1) Support and secure transmission to jack with safety chains.

(2) Raise and align transmission input shaft with clutch disc, then slide transmission into place.

(3) Install and tighten transmission bolts to 54-61 N·m (40-45 ft. lbs.). Be sure front housing is fully seated before tightening bolts. Install front dust cover after all bolts are tightened.

(4) Fill transmission with Mopar lubricant. Correct fill level is to bottom edge of fill plug hole.

(5) Connect backup lamp switch wires.

(6) Connect transmission harnesses to clips on case.

(7) Install crossmember. Tighten crossmember-to-frame bolts to 68 N·m (50 ft. lbs.).

(8) Tighten crossmember-to-transmission insulator nuts to 68 N·m (50 ft. lbs.).

(9) Install slave cylinder. Tighten cylinder nuts to 23 N·m (200 in. lbs.).

(10) Remove jack used to support transmission.

(11) Install strut bolts/nuts, if removed. Also install oil filter if removal was necessary.

(12) Install and connect exhaust system. Align exhaust components before tightening clamp and bracket bolts and nuts. Be sure exhaust components are clear of all chassis and driveline components.

TWO WHEEL DRIVE

(1) Align and install propeller shaft.

(2) Verify that all linkage components, hoses and electrical wires have been connected.

(3) Remove any remaining support stands and lower vehicle.

(4) Install crankshaft position sensor.

(5) Connect battery negative cable.

(6) Install shift tower and lever assembly. Tighten shift tower bolts to 7-10 N·m (5-7 ft. lbs.).

(7) Install the shift lever extension onto the shift tower and lever assembly.

(8) Install shift boot and bezel.

FOUR WHEEL DRIVE

(1) Install transfer case. Align and position transfer case with transmission jack or aid of helper.

(2) Install and tighten transfer case attaching nuts to 47 N·m (35 ft. lbs.).

(3) Install and connect transfer case shift linkage.

(4) Align and install front and rear propeller shafts.

(5) Verify that all linkage components, hoses and electrical wires have been connected.

(6) Check transfer case fluid level. Add Mopar Dexron II, or ATF Plus if necessary. Correct level is to edge of fill plug hole. Be sure transfer case is level before checking or adding fluid.

(7) Check and adjust transfer case shift linkage if necessary.

(8) Install transfer case skid plate, if equipped.

(9) Install crankshaft position sensor.

(10) Remove any remaining support stands and lower vehicle.

(11) Connect battery negative cable.

(12) Install shift tower and lever assembly. Tighten shift tower bolts to 7-10 N·m (5-7 ft. lbs.).

(13) Install the shift lever extension onto the shift tower and lever assembly.

(14) Install shift boot and bezel.

MANUAL - NV4500

DESCRIPTION

The NV4500 is a five speed constant mesh manual transmission (Fig. 1). All gear ranges including reverse are synchronized. Fifth gear is an overdrive range. The transmission has a cast iron gear case and aluminum shift cover.

Two versions are used, a standard duty for 5.9L applications and a heavy duty for V10 and Cummins diesel applications. Main differences are the larger diameter input shaft, output shaft, and mainshaft fifth gear in the heavy duty model.

Tapered roller bearings support the drive gear, mainshaft and countershaft in the gear case. Roller bearings in the drive gear support the forward end of the mainshaft. The mainshaft gears are all supported on caged type roller bearings. Drive gear thrust reaction is controlled by a needle type thrust bearing. The bearing is located at the forward end of the mainshaft.

The transmission is a top loader style. The shift lever is located in a shifter tower which is bolted to the shift cover and operates the shift forks and rails directly. The shift forks and rails are all located within the aluminum cover which is bolted to the top of the gear case.

80b171e7

Fig. 1 NV4500 Manual Transmissions

MANUAL - NV4500 (Continued)**SHIFT PATTERN**

The shift pattern is in a modified H pattern (Fig. 2). Overdrive fifth and reverse gears are in line and outboard of the first through fourth gear positions.

J9221-13

FIRST	5.61:1
SECOND	3.04:1
THIRD	1.67:1
FOURTH	1.00:1
FIFTH	0.75:1
REVERSE	5.04:1

IDENTIFICATION

The transmission identification tag is attached to the driver side PTO cover (Fig. 3).

The tag provides the transmission model number, build date and part number. Be sure to reinstall the I.D. tag if removed during service. The information on the tag is essential to correct parts ordering.

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point, all the transmission gears are spinning.

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow

J9221-14

Fig. 3 Identification Tag Location

1 - PTO COVER

2 - I.D. TAG

down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

DIAGNOSIS AND TESTING - MANUAL TRANSMISSION**LOW LUBRICANT LEVEL**

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer.

MANUAL - NV4500 (Continued)

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Shift transmission into Neutral.
- (3) Remove shift boot screws from floorpan and slide boot upward on the shift lever.
- (4) Remove shift lever extension from shift tower and lever assembly.

- (5) Remove shift tower bolts holding tower to isolator plate and transmission shift cover.

- (6) Remove shift tower and isolator plate from transmission shift cover.

- (7) Raise and support vehicle.

- (8) Remove skid plate, if equipped.

- (9) Mark propeller shaft and axle yokes for installation reference and remove shaft/shafts.

- (10) Remove exhaust system Y-pipe.

- (11) Disconnect speed sensor and backup light switch connectors.

- (12) Support engine with safety stand and a wood block.

- (13) If transmission is to be disassembled for, remove drain bolt at bottom of PTO cover and drain lubricant (Fig. 4).

Fig. 4 NV4500 Drain Bolt

- 1 - PTO COVER
- 2 - DRAIN BOLT
- 3 - FILL PLUG

TWO WHEEL DRIVE

- (1) Remove nuts/bolts attaching transmission to rear mount.

- (2) Support and secure transmission with safety chains to a transmission jack.

- (3) Remove rear crossmember.

- (4) Remove clutch slave cylinder bolts and move cylinder aside for clearance.

- (5) Remove transmission harness wires from clips on transmission shift cover.

- (6) Remove transmission to clutch housing bolts.

- (7) Slide transmission and jack rearward until input shaft clears clutch housing.

- (8) Lower transmission jack and remove transmission from under vehicle.

FOUR WHEEL DRIVE

- (1) Disconnect transfer case shift linkage at transfer case range lever. Then remove transfer case shift mechanism from transmission (Fig. 5).

- (2) Support and secure transfer case to transmission jack with safety chains.

- (3) Remove transfer case mounting nuts.

**Fig. 5 Transfer Case Shift Mechanism-Typical**

1 - TRANSMISSION

2 - TRANSFER CASE SHIFT MECHANISM

(4) Move transfer case rearward until input gear clears transmission mainshaft.

(5) Lower transfer case assembly and move it from under vehicle.

(6) Support and secure transmission with safety chains to a transmission jack.

(7) Remove transmission harness from retaining clips on transmission shift cover.

(8) Remove bolts/nuts attaching transmission mount to rear crossmember.

(9) Remove rear crossmember.

(10) Remove clutch slave cylinder splash shield, if equipped.

(11) Loosen clutch slave cylinder attaching nuts until cylinder piston rod is clear of release lever. This reduces pressure on lever and release bearing making transmission removal/installation easier. Cylinder does not have to be removed completely.

(12) Remove transmission bolts from clutch housing.

(13) Move transmission rearward until input shaft clears clutch disc and release bearing.

(14) Lower transmission and remove it from under vehicle.

DISASSEMBLY

EXTENSION/ADAPTER HOUSING

(1) Raise and support vehicle.

(2) Remove rear propeller shaft.

(3) Support transmission with a transmission jack.

(4) Remove engine rear support. Refer to 9 Engine for procedures.

(5) Remove transfer case, if equipped.

(6) Remove bolts attaching extension/adapter housing to gear case (Fig. 6).

**Fig. 6 Extension/Adapter Housing Bolts**

1 - EXTENSION HOUSING

2 - BOLTS

(7) Remove extension/adapter housing (Fig. 7). There is one alignment dowel in the gear case and one in the extension/adapter housing.

(8) Remove rubber spline seal from end of mainshaft (Fig. 8). The seal is used to prevent lubricant loss during shipping and does not have to be replaced if damaged.

2 - RUBBER SPLINE SEAL

FIFTH GEAR NUT

- (1) Remove extension/adapter housing.
- (2) Loosen fifth gear clamp nut clamping screw approximately 1 1/2 turns.
- (3) Install nut Wrench 6743 on fifth gear nut (Fig. 9).

NOTE: Wrench only fits one way on nut. Be sure wrench is fully engaged in nut slots and is not cocked.

- (4) Install splined Socket 6993 4X2 Socket 6984 4X4 to retain mainshaft while removing the fifth gear nut.

- (5) Install breaker bar in socket wrench (Fig. 9)

NOTE: Wedge breaker bar handle against workbench. Purpose of socket wrench and breaker bar

is to prevent mainshaft from turning while nut is loosened.

- (6) Remove fifth gear nut, then remove belleville washer from mainshaft.

80b171f8

Fig. 9 Fifth Gear Nut

- 1 - WRENCH 6443/6743
2 - FIFTH GEAR NUT
3 - SOCKET 6993/6984

FIFTH GEAR

- (1) Remove roll pins that secure countershaft fifth gear shift fork to shift rail with pin punch (Fig. 10). Roll pins are driven out from bottom of fork and not from top.

- (2) Remove snap ring that secures fifth gear clutch hub and gear on countershaft (Fig. 11).

- (3) Remove countershaft fifth gear clutch gear and stop ring.

- (4) Remove fifth gear shift fork and gear assembly. Remove assembly by tapping fork off rail with plastic mallet.

- (5) Remove fifth gear shift fork from sleeve.

- (6) Remove sleeve, struts, and strut springs from countershaft fifth gear hub, if necessary.

- (7) Remove countershaft fifth gear needle bearing assembly (Fig. 12).

- (8) Remove cone shaped rear bearing thrust washer from end of countershaft (Fig. 13). Note position of washer for assembly reference. Also note that washer bore has notch for locating pin.

- (9) Remove and retain thrust washer locating pin from countershaft.

- (10) Remove mainshaft overdrive fifth gear with Puller Tool Set 6444.

(11) Position first Puller Jaw 6459 or 6820 on gear (Fig. 14).

(12) Assemble Puller Flange 6444-1 and Puller Rods 6444-3 4X2 vehicles or 6444-4 4X4 vehicles (Fig. 15).

(13) Slide assembled puller flange and rods onto output shaft. Then seat flange in notch of puller jaw (Fig. 15).

(14) Position second puller jaw on gear and in notch of puller flange (Fig. 16).

(15) Slide Retaining Collar 6444-8 over puller jaws to hold them in place (Fig. 16).

(16) Install Puller and Bolt 6444 on puller rods. Then secure puller to rods with retaining nuts (Fig. 17).

(17) Tighten puller bolt to remove gear from shaft splines (Fig. 17).

FRONT RETAINER

(1) Remove front retainer bolts (Fig. 19). Discard retainer bolts. They should not be reused.

Fig. 19 Front Bearing Retainer

- 1 - DRIVE GEAR
- 2 - FRONT BEARING RETAINER

(2) Remove retainer by lightly tapping it back and forth with plastic mallet. Then rock retainer back and forth by hand to work it out of gear case.

NOTE: Retainer flange extends into transmission case and is a snug fit.

(3) Remove seal from front retainer (Fig. 20). Collapse one side of seal then pry it out with pry tool.

Fig. 20 Bearing Retainer Seal

- 1 - SEAL
- 2 - FRONT BEARING RETAINER

(4) To remove front retainer bearing cup, assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 21).

(5) Insert Puller Jaws 6453-1 in puller flange (Fig. 21). Narrow lip of puller jaws will go under bearing cup.

Fig. 21 Puller Rods, Flange And Jaws

- 1 - RODS 6444-4
- 2 - FLANGE 6444-1
- 3 - JAWS 6453-1

(6) Install Disc C-4487-1 into bearing retainer on heavy duty transmissions for Insert 6453-2 to rest upon.

MANUAL - NV4500 (Continued)

(7) Install assembled tools in front retainer (Fig. 22). Be sure puller jaws are seated under bearing cup.

(8) Place Insert Tool 6453-2 in center of puller jaws (Fig. 22). Insert tool is used to hold puller jaws in place.

Fig. 22 Puller Tools In Front Retainer

- 1 - INSERT 6453-2
- 2 - FRONT RETAINER
- 3 - JAWS 6453-1

(9) Install Puller 6444 on puller rods (Fig. 23). Then install retaining nuts on puller rods.

(10) Tighten puller bolt to draw bearing cup out of retainer (Fig. 23).

DRIVE GEAR

(1) Remove drive gear (Fig. 24).

(2) Remove pilot bearing from drive gear (Fig. 25).

(3) To remove tapered bearing from drive gear, assemble Puller Flange 6444-1 and Puller Rods 6444-6 (Fig. 26). Then position first Puller Jaw 6447 on bearing

(4) Slide assembled puller flange and rod tools onto input shaft. Then seat flange in notch of puller jaw.

(5) Position second Puller Jaw 6447 on gear and in notch of puller flange.

(6) Slide Retaining Collar 6444-8 over puller jaws to hold them in place.

(7) Install Puller 6444 on puller rods then install retaining nuts.

(8) Tighten puller bolt to remove bearing cone from drive gear.

MAINSHAFT AND GEARTRAIN

- (1) Move 1-2 and 3-4 synchro sleeves into neutral.
(2) Remove drive gear thrust bearing from forward end of mainshaft (Fig. 27).

**Fig. 27 Drive Gear Thrust Bearing**

- 1 - MAINSHAFT
2 - DRIVE GEAR THRUST BEARING

- (3) Remove fourth gear clutch gear and synchro stop ring from mainshaft (Fig. 28).

**Fig. 28 Fourth Gear Clutch Gear Stop Ring**

- 1 - FOURTH GEAR SYNCHRO STOP RING
2 - FOURTH SPEED CLUTCH GEAR

- (4) Roll gear case onto left side (Fig. 29).
(5) To remove mainshaft assembly (Fig. 29) lift front end of mainshaft slightly.

NOTE: Handling mainshaft carefully because gears are loose on the mainshaft.

- (6) Grasp mainshaft rear splines, then turn spline end of mainshaft counterclockwise to rotate shaft and geartrain out of case. Tilt mainshaft outward and removed from case.

MANUAL - NV4500 (Continued)

**Fig. 29 Mainshaft And Geartrain**

REVERSE IDLER AND COUNTERSHAFT

(1) Remove countershaft rear bearing plate (Fig. 30).

**Fig. 30 Countershaft Rear Bearing Plate**

1 - REAR BEARING PLATE
2 - COUNTERSHAFT

(2) Remove countershaft end play shim and rear bearing cup (Fig. 31).

(3) Remove reverse idler shaft (Fig. 32).

**Fig. 31 Countershaft End Play Shim And Rear Bearing Cup**

1 - COUNTERSHAFT REAR BEARING CUP
2 - END PLAY SHIM

**Fig. 32 Reverse Idler Shaft**

1 - REVERSE IDLER SHAFT

(4) Rotate countershaft outward and push reverse idler gear away from countershaft and toward front of case (Fig. 33).

(5) Remove idler gear (Fig. 34).

MANUAL - NV4500 (Continued)

**Fig. 33 Idler Gear Moved Away From Countershaft**

- 1 - REVERSE IDLER GEAR
2 - COUNTERSHAFT

**Fig. 34 Reverse Idler Gear**

- 1 - REVERSE IDLER GEAR
2 - DRIVE GEAR BORE

(6) Keep reverse idler gear bearings and spacer together for cleaning and inspection (Fig. 35). Insert idler shaft through gear and bearings to keep them in place.

(7) Remove idler gear thrust washers from gear case. Install washers on idler shaft to keep them together for cleaning and inspection.

(8) To remove countershaft rear bearing, assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 36).

NOTE: Shaft cannot be removed from case until rear bearing has been removed.

**Fig. 35 Idler Gear Components**

- 1 - BEARINGS
2 - REVERSE IDLER GEAR

- (9) Position first Puller Jaw 6449 on bearing cone
(10) Seat puller flange in notch of puller jaw just installed on bearing cone
(11) Install second Puller Jaw 6449 on bearing and in notch of puller flange
(12) Slide Retaining Collar 6444-8 over puller jaws to hold them in place

NOTE: Retaining collar has small lip on one end and only fits one way over jaws.

(13) Install Puller 6444 on puller rods, then secure puller to rods with retaining nuts

(14) Tighten puller bolt to remove bearing from shaft. If bearing is exceptionally tight, tap end of puller bolt with copper mallet to help loosen bearing.

**Fig. 36 Countershaft Rear Bearing**

- 1 - COLLAR 6444-8
2 - JAWS 6449
3 - PULLER 6444
4 - WRENCH

MANUAL - NV4500 (Continued)

(15) Remove bearing puller tools then rotate countershaft out of gear case (Fig. 37).

Fig. 37 Countershaft And Case

1 - COUNTERSHAFT

(16) To Remove countershaft front bearing, assemble Puller Flange 6444-1 and Puller Bolts 6444-4 (Fig. 38).

(17) Position first Puller Jaw 6451 on bearing.

(18) Seat puller flange in notch of puller jaw.

(19) Install second Puller Jaw 6451 on bearing and in notch of puller flange.

(20) Slide Retaining Collar 6444-8 over puller jaws to hold them in place

NOTE: Retaining collar has small lip on one end and only fits one way over jaws.

(21) Install puller bridge and bolt assembly 6444 on puller bolts and install retaining nuts

(22) Tighten puller bolt to remove bearing from shaft. If bearing is exceptionally tight, tap end of puller bolt with mallet to help loosen bearing.

(23) Remove bearing puller tools.

Fig. 38 Countershaft Front Bearing

1 - JAWS 6451

2 - COLLAR 6444-8

3 - PULLER 6444

4 - FLANGE 6444-1

GEAR CASE

(1) Remove countershaft front bearing cap with mallet or hammer (Fig. 39).

Fig. 39 Countershaft Front Bearing Cap

1 - HAMMER

2 - BEARING CAP

MANUAL - NV4500 (Continued)

(2) Remove countershaft front bearing cup with Remover 6454 and Handle C-4171 (Fig. 40).

Fig. 40 Countershaft Front Bearing Cup

- 1 - REMOVER 6454
2 - HANDLE C-4171

(3) Remove roll pin that secures shift lug on shift rail in case (Fig. 41). A small pin punch can be modified by putting a slight bend in it to drive pin completely out of shift rail (Fig. 41).

Fig. 41 Shift Lug Roll Pin

- 1 - PUNCH
2 - 30° BEND
3 - PIN PUNCH MODIFICATION
4 - SHIFT LUG
5 - SHIFT RAIL

(4) Remove shift lug rail.

MAINSHAFT

NOTE: Not all of the mainshaft gear and synchro components are a one-way fit. Some gear and synchro components can be installed backwards. Paint or scribe gear and synchro components for installation reference. Then stack geartrain parts in order of removal to avoid incorrect assembly.

(1) Remove drive gear thrust bearing from end of mainshaft, if not previously removed.

(2) Remove 3-4 synchro hub, third gear stop ring and third gear as an assembly (Fig. 42).

Fig. 42 Third Gear, Stop Ring, And 3-4 Hub

- 1 - THIRD GEAR
2 - THIRD GEAR STOP RING
3 - 3-4 SYNCHRO HUB

MANUAL - NV4500 (Continued)

(3) Remove third gear bearing from mainshaft (Fig. 43).

80aa016e

Fig. 43 Third Gear Bearing

1 - THIRD GEAR NEEDLE BEARING

(4) Remove third gear bearing spacer (Fig. 44).
 (5) Remove second gear thrust washer snap ring from mainshaft (Fig. 44).

J9221-122

Fig. 44 Snap Ring And Third Gear Bearing Spacer

1 - SECOND GEAR THRUST WASHER
 2 - THRUST WASHER SNAP RING
 3 - THIRD GEAR BEARING SPACER

(6) Remove second gear thrust washer (Fig. 45). Note that washer is notched for locating pin.

(7) Remove thrust washer locating pin (Fig. 46). Use needle nose pliers to remove pin.

J9221-123

Fig. 45 Second Gear Thrust Washer

1 - SECOND GEAR
 2 - THRUST WASHER
 3 - SECOND GEAR BEARING

J9221-126

Fig. 46 Thrust Washer Locating Pin

Fig. 47 Second Gear

1 - SECOND GEAR

(9) Remove second gear bearing (Fig. 48).

Fig. 48 Second Gear Bearing

1 - SECOND GEAR NEEDLE BEARING

(10) Remove second gear clutch cone snap ring (Fig. 49). Snap ring is seated in mainshaft synchro hub groove.

Fig. 49 Second Gear Clutch Cone Snap Ring

1 - 1-2 SLEEVE

2 - SNAP RING

3 - SECOND GEAR CLUTCH CONE

(11) Remove second gear clutch cone, synchro clutch ring and synchro stop ring (Fig. 50).

Fig. 50 Second Gear Clutch Cone And Ring

1 - 1-2 SLEEVE AND HUB

2 - SYNCHRO STOP RING

3 - CLUTCH RING

4 - SECOND GEAR CLUTCH CONE

MANUAL - NV4500 (Continued)

(12) Remove 1-2 synchro hub snap ring (Fig. 51).

Fig. 51 1-2 Sleeve And Hub Snap Ring

- 1 - 1-2 HUB SNAP RING
2 - 1-2 SLEEVE AND HUB

(13) Remove 1-2 synchro sleeve, hub, struts and springs as an assembly (Fig. 52). Note that tapered side of sleeve also goes toward front. Do not disassemble synchro components unless worn or damaged.

Fig. 52 1-2 Synchro Sleeve And Hub

- 1 - 1-2 SLEEVE AND HUB

(14) Remove first gear synchro stop ring and clutch ring (Fig. 53).

Fig. 53 First Gear Stop And Clutch Ring

- 1 - FIRST GEAR CLUTCH RING
2 - FIRST GEAR STOP RING

(15) Remove first gear clutch cone front snap ring from mainshaft hub (Fig. 54).

Fig. 54 First Gear Clutch Gear Front Snap Ring

- 1 - FIRST SPEED CLUTCH GEAR
2 - CLUTCH GEAR SNAP RING (FRONT)

MANUAL - NV4500 (Continued)

(16) Remove first gear clutch cone (Fig. 55).

(17) Remove first gear clutch gear rear snap ring from mainshaft hub (Fig. 55). Do not remove this snap ring unless mainshaft is to be replaced.

(18) To remove mainshaft rear bearing, assemble Puller Flange 6444-1 and Puller Rods 6444-3 for 4X2 or 6444-4 for 4X4 (Fig. 56).

(19) Position the first Puller Jaw 6445 on the bearing cone.

(20) Seat Puller Flange 6444-1 in notch of first puller jaw.

(21) Install the second Puller Jaw 6445 on the bearing cone and puller flange.

(22) Install Puller 6444 on the puller rods and secure with nuts.

(23) Hold hex portion of Puller 6444 a wrench (Fig. 57) and tighten screw.

(24) Remove bearing puller tools and rear mainshaft bearing from output shaft.

J9221-133

Fig. 55 First Gear Clutch Gear

- 8 - RODS 6444-3 OR 6444-4

(25) Remove reverse gear thrust washer (Fig. 58).

J9221-135

Fig. 58 Reverse Gear Thrust Washer

- 1 - REVERSE GEAR
- 2 - THRUST WASHER

(26) Remove reverse gear and synchro components as assembly (Fig. 59). Do not disassemble synchro components unless they are damaged. If synchro sleeve or struts require service, mark position of

sleeve on hub before removal. Correct sleeve position is important as sleeve can be installed backwards causing shift problems.

(27) Remove reverse gear bearing assembly from mainshaft (Fig. 59).

(28) Remove reverse gear bearing spacer from mainshaft (Fig. 60).

(29) Remove reverse clutch gear snap ring (Fig. 60). Tension of this snap ring is considerable. Heavy duty snap ring pliers will be required to spread the ring far enough to remove it.

J9221-137

2 - FIRST GEAR BEARING

CLEANING

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean the shaft bearings with a mild solvent such as Mopar® degreasing solvent, Gunk, or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry, or wipe them dry with clean shop towels.

INSPECTION - TRANSMISSION

Inspect the reverse idler gear, bearings, shaft and thrust washers. Replace the bearings if the rollers are worn, chipped, cracked, flat-spotted or brinnelled. Or if the bearing cage is damaged or distorted. Replace the thrust washers if cracked, chipped or worn. Replace the gear if the teeth are chipped, cracked or worn thin.

Inspect the drive gear and bearings. Minor scratches and burrs on the gear surfaces can be reduced with an oil stone and 400 grit paper wetted with oil. Replace either bearing if worn, or damaged. Replace the gear if any teeth, splines, or bearing surfaces are also worn or damaged.

Inspect the front bearing retainer and bearing cup. Replace the bearing cup if scored, cracked, brinnelled or rough. Check the release bearing slide surface of the retainer carefully. Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth. Wet the abrasive paper and crocus cloth with oil when smoothing/polishing. Replace the retainer if worn or damaged in any way. Do not reuse original retainer bolts. Install new bolts during assembly.

Inspect the countershaft and bearings. Replace the bearings if worn, rough, flat spotted or heat checked. Check the countershaft gear teeth carefully. Small nicks, scratches or burrs can be removed with an oil stone and 400 grit paper wetted with oil. Replace the shaft if any of the teeth are worn, cracked, broken or severely chipped.

Be sure to check condition of the countershaft bearing cups. Replace either bearings cup if worn, or damaged.

Check condition of the mainshaft. Inspect all the bearing surfaces, splines and threads. Also check condition of the snap ring grooves in the hub area and the speedometer drive gear teeth. Minor scratches or burrs can be removed with an oil stone and polished with crocus cloth. However, replace the shaft if any surfaces exhibit considerable wear or damage.

Check condition of the gear case and extension or adapter housing. Be sure the alignment dowels in the

MANUAL - NV4500 (Continued)

case top surface and in the housing/adaptor are tight and in good condition.

Run a tap through the gear case bolt holes if the threads need minor cleanup. Helicoil inserts can be used to repair seriously damaged threaded holes if necessary.

Be sure all case and housing/adaptor sealing and mating surfaces are free of burrs and nicks. This is especially important as gaskets are not used in the transmission. Minor nicks and scratches on the sealing surfaces can be dressed off with a fine tooth file or oil stone.

Replace the gear case or housing/adaptor if cracked or broken. Do not attempt to repair this type of damage by welding or brazing.

Check condition of the countershaft fifth gear components. This includes the shift lug and rail located in the gear case and the rail bushings.

Inspect the gear and hub assembly. Minor burrs can be cleaned up with an oil stone. However, the gear and hub assembly should be replaced if the teeth or splines are excessively worn, or damaged. The synchro sleeve should also be replaced if worn or damaged in any way. Do not reuse synchro struts that are worn or springs that are collapsed or severely distorted. Replace worn distorted synchro parts to avoid shift problems after assembly and installation.

The shift fork should be inspected for evidence of wear and distortion. Check fit of the sleeve in the fork to be sure the two parts fit and work smoothly. Replace the fork if the roll pin holes are worn over-size or damaged. Do not attempt to salvage a worn fork. It will cause shift problems later on. Replace shift fork roll pins if necessary or if doubt exists about their condition.

The bearings should be examined carefully for wear, roughness, flat spots, pitting or other damage. Replace the bearings if necessary.

Inspect the blocker ring and clutch gear. replace either part if worn or damaged in any way. Also be sure replacement parts fit properly before proceeding with assembly.

Examine the 1-2 synchro hub and sleeve for wear or damage. Replace sleeve and hub if the splines are worn, chipped or damaged.

Replace the synchro struts if worn, or chipped. Also replace the springs if collapsed, distorted or broken.

Inspect the mainshaft geartrain components. Check teeth on all gears, hubs, clutch gears, stop rings and clutch rings. The teeth must be in good condition and not worn, cracked or chipped. Replace any component that exhibits wear or damage.

Examine the synchro stop rings, clutch rings and clutch gears. Replace any part that exhibits wear,

distortion or damage. Replace the clutch rings if the friction material is burned, flaking off or worn.

Inspect all of the thrust washers and locating pins. Replace the pins if bent or worn. Replace the washers if worn or the locating pin notches are distorted.

Check condition of the synchro struts and springs. Replace these parts if worn, cracked or distorted.

ASSEMBLY

NOTE: Gaskets are not used in the NV4500 transmission. Use Mopar® Silicone Sealer or equivalent on all gear case and extension housing sealing surfaces.

COUNTERSHAFT AND REVERSE IDLER GEAR

(1) Install countershaft front bearing cup in case with Handle C-4171 and Installer 6061-1.

(2) Install front bearing on countershaft with Installer C-4340 (Fig. 64).

Fig. 64 Countershaft Front Bearing

- 1 - FRONT BEARING
- 2 - INSTALLER C-4340
- 3 - COUNTERSHAFT

(3) Lubricate countershaft front bearing cup and cone with petroleum jelly.

(4) Position gear case on end with rear of case facing up (Fig. 65).

(5) Install countershaft in gear case (Fig. 65).

NOTE: Do not install rear countershaft bearing on countershaft at this time.

80b1b2b7

Fig. 65 Countershaft In Gear Case

- 1 - GEAR CASE
2 - COUNTERSHAFT

(6) Lubricate reverse idler gear bearings with petroleum jelly and install first bearing and second bearing (Fig. 66).

(7) Install idler gear front thrust washer on boss in gear case (Fig. 66). Coat thrust washer with liberal quantity of petroleum jelly to hold it in place.

J9221-162

Fig. 66 Idler Gear Front Thrust Washer

- 1 - POSITION IDLER GEAR FRONT THRUST WASHER ON BOSS

- (8) Install reverse idler gear in case (Fig. 67).
(9) Install idler gear rear thrust washer between idler gear and case boss (Fig. 67).

J9221-163

Fig. 67 Idler Gear

- 1 - REAR THRUST WASHER
2 - REVERSE IDLER GEAR
3 - FRONT THRUST WASHER

(10) Align idler gear bearings and thrust washers with a drift.

(11) Install reverse idler shaft with notched end of shaft facing countershaft (Fig. 68).

80b1b2b8

Fig. 68 Reverse Idler Shaft

- 1 - COUNTERSHAFT
2 - SHAFT NOTCH MUST FACE COUNTERSHAFT
3 - REVERSE IDLER SHAFT

MANUAL - NV4500 (Continued)

(12) Lift countershaft upward and position wood block between front of shaft and case (Fig. 69).

Fig. 69 Supporting Countershaft With Wood Block

- 1 - COUNTERSHAFT
2 - WOOD BLOCK

(13) Install rear bearing cone on countershaft with Installer C-4040 (Fig. 70).

Fig. 70 Countershaft Rear Bearing

- 1 - INSTALLER C-4040
2 - REAR BEARING
3 - COUNTERSHAFT

(14) Remove wood block from under countershaft and lower countershaft front bearing into front bearing cup.

(15) Lubricate countershaft rear bearing cup and cone with petroleum jelly.

(16) Install countershaft rear bearing cup in gear case and over rear bearing (Fig. 71). Tap cup into place with plastic mallet if necessary.

Fig. 71 Countershaft Rear Bearing Cup

- 1 - COUNTERSHAFT REAR BEARING CUP

(17) Install countershaft rear bearing plate (Fig. 72).

NOTE: Verify plate is seated in notch in reverse idler shaft before tightening bearing plate bolts.

Fig. 72 Countershaft Rear Bearing Plate

- 1 - COUNTERSHAFT
2 - REAR BEARING PLATE
3 - IDLER SHAFT

MANUAL - NV4500 (Continued)

(18) Apply Mopar® silicone adhesive/sealer to flange and lip of new cap. Install **new** front bearing cap in gear case (Fig. 73) with Handle C-4171 and Installer C-3972-A.

Fig. 73 Countershaft Front Bearing Cap

1 - FRONT BEARING CAP (SEAT WITH WOOD BLOCK)

COUNTERSHAFT END PLAY

- (1) Rotate countershaft 4-5 times to seat bearings.
- (2) Mount dial indicator on case. Then position indicator plunger on end of countershaft and zero dial indicator (Fig. 74).
- (3) Raise countershaft with screwdriver and note end play reading on dial indicator. End play should be 0.051 - 0.15 mm (0.002 - 0.006 in.).

Fig. 74 Measuring Countershaft End Play

1 - DIAL INDICATOR
2 - COUNTER SHAFT
3 - INDICATOR MOUNTING ARM AND BASE

(4) Remove countershaft rear bearing plate.

(5) Install a end play shim that will provide minimum countershaft end play. Position shim on rear bearing cup (Fig. 75).

Fig. 75 Countershaft End Play Shim

1 - REAR BEARING CUP
2 - END PLAY SHIM (SELECTIVE)

(6) Install countershaft rear bearing plate (Fig. 72).

NOTE: Verify plate is seated in reverse idler shaft notch and end play shims are still in position before installing bolts.

(7) Apply 1-2 drops Mopar® Loc N' Seal or equivalent to threads of rear bearing plate bolts. Then install and tighten bearing plate bolts to 23 N·m (200 in. lbs.).

SHIFT LUG AND RAIL

- (1) Lubricate shift lug and rail with Castrol® Syn-torq.
- (2) Insert shift lug rail part way into case.
- (3) Install shift lug on rail.
- (4) Position shift rail so roll pin notches are toward outside of case (Fig. 76).
- (5) Install roll pin that secures lug to rail (Fig. 76).

MAINSHAFT AND GEARTRAIN

CAUTION: The reverse, 1-2 and 3-4 synchro components can be assembled and installed incorrectly. Follow assembly procedures for component identification and location.

Lubricate mainshaft bearing surfaces and all bearing assemblies with Castrol Syntorq or with petroleum jelly.

(1) Install first snap ring in rear most groove of mainshaft hub (Fig. 77). This snap ring locates first gear clutch gear on shaft.

MANUAL - NV4500 (Continued)

J9221-171

Fig. 76 Shift Lug And Rail

- 1 - NOTCHES (FOR 5TH GEAR SHIFT FORK ROLL PINS)
- 2 - LUG RAIL
- 3 - ROLL PIN HOLE
- 4 - SHIFT LUG

NOTE: Four of these snap rings are used to secure various components on the mainshaft 1-2 synchro hub. The snap rings are all the same size and are interchangeable.

J9221-176

Fig. 77 First Gear Bearing and Snap Ring

- 1 - SNAP RING
- 2 - FIRST GEAR BEARING
- 3 - MAINSHAFT SYNCHRO HUB

(2) Install first gear clutch cone on mainshaft 1-2 synchro hub with recessed side of cone facing front (Fig. 78). Verify cone is seated against snap ring on hub.

(3) Install snap ring on mainshaft 1-2 synchro hub to secure clutch cone (Fig. 79). Verify snap ring is seated in hub groove and against clutch cone.

80aa0f8b

Fig. 78 First Gear Clutch Cone

- 2 - MAINSHAFT 1-2 SYNCHRO HUB
- 3 - CLUTCH CONE SNAP RING

(4) Support mainshaft in upright position to install remaining gears, snap rings and synchro components. Shaft can be supported in gear case or hole can be cut in workbench to support shaft.

(5) If 1-2 synchro hub and sleeve were disassembled for service, reassemble hub, sleeve, struts and springs as follows:

(a) Align and install sleeve on hub. Rotate sleeve until it slides onto hub. Sleeve only fits one way and will easily slide onto hub when long slot in sleeve, aligns with long shoulder on hub (Fig. 80).

(b) Place wood blocks under hub that will raise hub about 3.5 cm (1.375 in.) above surface of workbench. Then allow sleeve to drop down on hub (Fig. 81).

MANUAL - NV4500 (Continued)

(c) Install springs and struts in hub (Fig. 81). Use lots of petroleum jelly to hold them in place. Then compress struts with your fingers and move sleeve upward until struts are started in sleeve. Verify that struts are engaged in sleeve before proceeding.

(d) Turn synchro assembly upright. Then move sleeve into neutral position on hub and work struts into sleeve at same time. Be sure struts are seated and springs are not displaced during assembly.

Fig. 80 1-2 Synchro Sleeve On Hub

NOTE: If snap ring will not fit in groove, clutch cone is slightly misaligned.

80aa0f9c

Fig. 85 Second Gear Clutch Cone, Clutch Ring And Stop Ring

- 1 - STOP RING
- 2 - CLUTCH RING
- 3 - CLUTCH CONE

(10) Install assembled second gear clutch cone and rings on mainshaft and in 1-2 synchro hub (Fig. 86).

(11) Install snap ring that secures second gear clutch cone on mainshaft (Fig. 87). Use narrow blade screwdriver to work snap ring into hub groove as shown. Verify snap ring is seated in mainshaft groove.

80aa0fbf

Fig. 87 Second Gear Clutch Cone Snap Ring

- 1 - SCREWDRIVER
- 2 - MAINSHAFT HUB
- 3 - SNAP RING
- 4 - SECOND GEAR CLUTCH CONE

MANUAL - NV4500 (Continued)

(12) Install second gear bearing on mainshaft (Fig. 88).

Fig. 88 Second Gear Bearing

1 - SECOND GEAR BEARING

(13) Install second gear on mainshaft and bearing. Rotate gear until tabs of second gear clutch ring are seated in tab slots in gear (Fig. 89).

Fig. 89 Second Gear

1 - SECOND GEAR
2 - CLUTCH RING TABS
3 - TAB SLOTS (IN GEAR)

(14) Install thrust washer pin in shaft (Fig. 90).
(15) Install second gear thrust washer. Verify washer is seated on gear and pin (Fig. 91).

(16) Install second gear thrust washer snap ring (Fig. 92). Verify snap ring is seated in mainshaft groove.

(17) Install third gear bearing spacer on shaft and seat it against thrust washer snap ring (Fig. 92).

(18) Install third gear bearing on mainshaft (Fig. 93). Bearing should be flush with mainshaft hub.

80aa0fc1

Fig. 90 Thrust Washer Pin

1 - THRUST WASHER PIN
2 - SECOND GEAR

80aa0fc2

Fig. 91 Second Gear Thrust Washer

1 - SECOND GEAR
2 - SECOND GEAR THRUST WASHER
3 - LOCATING PIN IN WASHER NOTCH

NOTE: If bearing is not flush with hub, the bearing spacer or snap ring was not installed.

(19) Install third gear over bearing and onto mainshaft (Fig. 94).

(20) Install synchro stop ring on third gear (Fig. 95). Verify stop ring is seated on cone taper.

(21) If 3-4 synchro was disassembled for service, reassemble synchro components as follows:

(a) Align and install synchro sleeve on hub (Fig. 96). **Front side of hub has a narrow groove machined in it.**

(b) Insert all three synchro struts in slots machined in sleeve and hub (Fig. 96).

(c) Install and seat synchro springs (Fig. 96). Use flat blade or Phillips screwdriver to compress springs and seat them in struts and hub as shown.

MANUAL - NV4500 (Continued)

J9221-122

Fig. 92 Snap Ring And Third

Fig. 96 Synchro Assembly (3-4)

- 1 - STRUT (3)
- 2 - SPRING (3)
- 3 - 3-4 SLEEVE
- 4 - 3-4 HUB

(22) Start 3-4 synchro assembly on mainshaft with the hub groove and sleeve groove both facing forward. Tap assembly onto shaft splines until hub is about 3 mm (0.125 in.) away from third gear stop ring. Then align stop ring with synchro sleeve and hub and seat synchro assembly with Installer C-4040 (Fig. 97).

(23) Verify 3-4 synchro hub is seated on shaft with approximately 3 mm (0.125 in.) of shaft spline visible.

NOTE: If hub is not seated, stop ring lugs are misaligned. Rotate ring until lugs are engaged in 3-4 hub slots.

(24) Verify that second and third gear rotate freely at this point. If not, determine the cause and correct.

(25) Invert mainshaft in case or bench.

MANUAL - NV4500 (Continued)

**Fig. 97 Seating 3-4 Synchro Assembly On Mainshaft**

- 1 - 3-4 SYNCHRO HUB
2 - HUB GROOVE
3 - INSTALLER C-4040

(26) Install first gear bearing on mainshaft.

(27) Install first gear on shaft with clutch hub side of gear facing the front of shaft (Fig. 98). Verify tabs on clutch ring are aligned and seated in first gear hub.

NOTE: 1-2 synchro hub will not seat properly if clutch ring tabs are misaligned.

(28) Install reverse clutch gear on first gear (Fig. 98). Verify clutch gear is seated on shaft splines.

(29) Install reverse clutch gear snap ring with heavy duty snap ring pliers (Fig. 98). Verify snap ring is seated in groove.

NOTE: Reverse gear will not fit properly if snap ring is not seated.

**Fig. 98 First Gear And Clutch Gear**

- 1 - FIRST GEAR
2 - REVERSE CLUTCH GEAR SNAP RING
3 - REVERSE CLUTCH GEAR

(30) Install stop ring on clutch cone (Fig. 99). Verify stop ring is seated on cone taper.

80aa0fc5

Fig. 99 Clutch Gear Stop Ring

- 1 - REVERSE GEAR STOP RING
2 - CLUTCH GEAR
3 - FIRST GEAR

(31) Install reverse gear bearing spacer on mainshaft and seat against reverse clutch gear snap ring (Fig. 100).

(32) Install reverse gear bearing on mainshaft (Fig. 100).

J9221-192

Fig. 100 Reverse Gear Bearing And Spacer

- 1 - REVERSE GEAR BEARING
2 - BEARING SPACER
3 - FIRST GEAR

(33) If reverse gear sleeve and struts were disassembled for service, reassemble sleeve, struts and springs as follows:

CAUTION: The reverse sleeve will fit either way on the hub. Verify tapered side of the sleeve faces rearward.

(a) Position sleeve on hub so tapered side of sleeve faces rearward. (Fig. 101).

(b) Rotate sleeve to align teeth on sleeve and hub. Sleeve will slide easily into place on hub when properly aligned.

MANUAL - NV4500 (Continued)

(c) Install springs in gear hub (Fig. 101). Use petroleum jelly to hold springs in place if desired.

(d) Compress first spring with flat blade screwdriver and slide strut into position in hub slot. Then work spring into seat in strut with small hooked tool or screwdriver.

(e) Install second and third struts in same manner as described in step (d).

(f) Work sleeve upward on hub until struts are centered and seated in sleeve. Sleeve should be in neutral position after seating struts.

J9221-189

Fig. 101 Reverse Gear Synchro Assembly

- 1 - REVERSE GEAR
- 2 - SLEEVE
- 3 - SPRING (3)
- 4 - STRUT (3)
- 5 - HUB

(34) Install reverse gear and synchro assembly on mainshaft (Fig. 102). Rotate assembly until stop ring lugs engage in hub slots and gear drops into seated position.

(35) Install reverse gear thrust washer (Fig. 103).

(36) Install rear bearing on mainshaft with Installer 6446. Seat bearing on output shaft and against thrust washer (Fig. 104).

J9221-193

MANUAL - NV4500 (Continued)

(37) Install fourth gear stop ring in 3-4 synchro sleeve (Fig. 105).

J9221-229

Fig. 105 Fourth gear Stop Ring

- 1 - 3-4 SYNCHRO SLEEVE
2 - FOURTH SPEED STOP RING

(38) Install fourth gear clutch gear in stop ring (Fig. 106).

J9221-230

Fig. 106 Fourth gear Clutch Gear

- 1 - FOURTH SPEED CLUTCH GEAR

(39) Roll gear case onto its left side.

(40) Grip mainshaft at pilot bearing hub and just behind reverse gear. Then lift assembly and guide rear of shaft through bearing bore at rear of case.

(41) Continue holding front of shaft but switch grip at rear to shaft output splines. Lift mainshaft assembly slightly, align gears and seat assembly in case.

(42) Set transmission case upright (Fig. 107).

(43) Install drive gear thrust bearing on mainshaft (Fig. 108). Use plenty of petroleum jelly to hold bearing in place.

(44) Check alignment and mesh of mainshaft gears. If gears are not aligned, roll case on side and realign shaft and gears in case.

J9221-221

Fig. 107 Mainshaft And Geartrain In Case

J9221-110

Fig. 108 Drive Gear Thrust Bearing

- 1 - MAINSHAFT
2 - DRIVE GEAR THRUST BEARING

DRIVE GEAR AND RETAINER

(1) Install bearing on drive gear with Installer 6448 (Fig. 109).

(2) Lubricate pilot bearing with petroleum jelly and install it in drive gear bore.

(3) Install drive gear on mainshaft. Work gear rearward until mainshaft hub is seated in pilot bearing.

(4) Install bearing cup in front retainer with Handle C-4171 and Installer C-4308 (Fig. 110).

(5) Install new oil seal in front bearing retainer with Installer 6052 (Fig. 111). Use one or two wood blocks to support retainer as shown. Lubricate seal lip with petroleum jelly after installation.

(6) Clean contact surfaces of gear case and front bearing retainer with a wax and grease remover.

MANUAL - NV4500 (Continued)

**Fig. 109 Front Bearing On Drive Gear**

**Fig. 112 Location Of Front Retainer Lube Channel**

- 1 - LUBE CHANNEL
 2 - FRONT RETAINER
 3 - APPLY GASKET MAKER HERE

(7) Apply Mopar® Silicone Sealer or equivalent to flange surface of front bearing retainer (Fig. 112).

(8) Install front bearing retainer over drive gear and start it into case.

(9) Start front bearing retainer in gear case. Verify retainer lube channel is at the top-center (**12 O'clock**) position (Fig. 112).

(10) Align front bearing retainer bolt holes and tap retainer into place with plastic mallet. Install **new** retainer bolts and tighten to 30 N·m (22 ft. lbs.) (Fig. 113).

NOTE: Never reuse the old bolts.

MANUAL - NV4500 (Continued)

**Fig. 113 Front Bearing Retainer**

- 1 - DRIVE GEAR
2 - FRONT BEARING RETAINER

MAINSHAFT END PLAY

(1) Install mainshaft rear bearing cup in case and over bearing. Tap bearing cup into place with plastic mallet.

(2) Install rear bearing plate to hold mainshaft and rear bearing in position (Fig. 114).

NOTE: Do not install any end play shims at this time.

(3) Tighten rear bearing plate bolts securely.

(4) Place gear case in upright position on bench. Either cut hole in bench to accept drive gear and front retainer or use C-clamps to secure transmission on bench.

NOTE: Do not leave transmission unsupported.

(5) Install Extension Rod 8161 into a suitable threaded hole in rear of case.

(6) Mount dial indicator on extension rod and position indicator plunger against end of mainshaft.

(7) Move mainshaft forward to remove all play then zero dial indicator.

(8) Move mainshaft upward and record dial indicator reading. Move mainshaft with pry tool positioned between drive gear and case.

(9) End play should be 0.051-0.15 mm (0.002-0.006 in.). Select fit shims are available to adjust end play. If end play adjustment is required, remove bearing plate and install necessary shim.

(10) Reinstall rear bearing plate with oil hole in bearing plate at the top (Fig. 114).

(11) Apply Mopar® Lock N' Seal or equivalent to bearing plate bolt threads. Install and tighten bolts to 23 N·m (200 in. lbs.).

**Fig. 114 Rear Bearing Plate**

- 1 - BEARING PLATE OIL HOLE (AT TOP)
2 - MAINSHAFT REAR BEARING PLATE

(12) Install mainshaft fifth gear with Installer 6446 (Fig. 115). Gear is seated when it contacts rear bearing.

J9221-220

J9221-238

Fig. 120 Fifth Gear Shift Fork In Synchro Sleeve

- 1 - SYNCHRO SLEEVE
2 - SHIFT FORK

MANUAL - NV4500 (Continued)

(6) Install assembled fifth gear, synchro sleeve and shift fork (Fig. 121). Align fork with shift lug rail and align gear with bearings and countershaft. Start components onto shaft and rail, then tap gear and fork into place with plastic or rawhide mallet.

80b1b2e4

Fig. 121 Countershaft Fifth Gear, Shift Fork And Synchro Sleeve

- 1 - SHIFT FORK AND SLEEVE
- 2 - FIFTH GEAR HUB
- 3 - SHIFT FORK ROLL PINS

(7) Install fifth gear synchro struts and springs (Fig. 122).

J9221-240

Fig. 122 Fifth Gear Synchro Struts And Springs

- 1 - FIFTH GEAR HUB
- 2 - SYNCHRO SPRING (3)
- 3 - SYNCHRO STRUT (3)

(8) Assemble and install fifth synchro clutch gear and stop ring in fifth gear hub (Fig. 123). Verify parts are seated in fifth gear hub.

80b1b2e5

Fig. 123 Fifth Synchro Clutch Gear And Stop Ring

- 1 - STOP RING
- 2 - CLUTCH GEAR

(9) Install clutch gear snap ring (Fig. 124).

J9221-89

Fig. 124 Fifth Synchro Clutch Snap Ring

- 1 - CLUTCH GEAR RING
- 2 - FIFTH SYNCHRO CLUTCH GEAR

(10) Align roll pin holes in shift fork with notches in shift lug rail. Then install roll pins from top side of fork (Fig. 121).

NOTE: Roll pins only fit one way due to small shoulder at one end of each pin.

FIFTH GEAR NUT

- (1) Install belleville washer onto the mainshaft.
- (2) Install fifth gear nut over the mainshaft.
- (3) Tighten the clamp bolt until the gap in the clamp nut assembly is closed.

MANUAL - NV4500 (Continued)

- (4) Back the clamp bolt off one full turn.
- (5) Place 10-15 drops of Loctite™ 272 onto the mainshaft threads where the fifth gear nut will be engaged.
- (6) Install fifth gear nut on mainshaft (Fig. 125).

**Fig. 125 Fifth Gear Nut**

- 1 - FIFTH GEAR
- 2 - FIFTH GEAR NUT

(7) There are two splined sockets available to retain the mainshaft while installing the fifth gear nut.

- 4X2 mainshafts Socket 6993
- 4X4 mainshafts Socket 6984

(8) Tighten fifth gear nut as much as possible with Nut Wrench 6743, long handle ratchet, breaker bar and applicable socket wrench (Fig. 126).

(9) Lock mainshaft gears by shifting all synchro sleeves into engaged position.

(10) Tighten fifth gear nut with Nut Wrench 6743 and high capacity torque wrench. Tighten nut to 366-380 N·m (270-280 ft. lbs.). Have helper hold transmission steady if necessary.

(11) Torque the fifth gear clamp nut clamping bolt to 13.5 N·m (10 ft. lbs.).

(12) Unlock the mainshaft gears by shifting all synchro sleeves out of the engaged position.

EXTENSION/ADAPTER HOUSING

(1) Clean mating surfaces of extension/adapter housing and gear case with a wax and grease remover.

(2) Check alignment dowels in gear case and housing or adapter. Be sure dowels are in position and seated.

(3) Apply Mopar® Silicone Sealer or equivalent to gear case and housing mating surfaces.

(4) Align and install extension/adapter housing on gear case (Fig. 127).

(5) Apply Mopar® Lock N' Seal or equivalent to threads of extension/adapter housing bolts.

**Fig. 126 Fifth Gear Nut**

- 1 - WRENCH 6443 OR 6743
- 2 - FIFTH GEAR NUT
- 3 - SOCKET 6443 OR 6743

**Fig. 127 Extension/Adapter Housing**

- 1 - GEAR CASE
- 2 - EXTENSION HOUSING

(6) Install and tighten housing bolts to 54 N·m (40 ft. lbs.).

(7) Install transfer case, if equipped.

(8) Install engine rear support. Refer to 9 Engine for procedures.

(9) Install propeller shaft(s).

(10) Remove transmission support stand and lower vehicle.

MANUAL - NV4500 (Continued)

INSTALLATION

NOTE: If a new transmission is being installed, be sure to use all components supplied with the new transmission. For example, if a new shift tower is supplied with the new transmission, do not re-use the original shift tower.

Before installation apply light coat of Mopar high temperature bearing grease to contact surfaces of following components:

- input shaft splines.
- release bearing slide surface of front retainer.
- release bearing bore.
- release fork.
- release fork ball stud.
- propeller shaft slip yoke.

(1) Apply sealer to threads of bottom PTO cover bolt and install bolt in case.

(2) Mount transmission on jack and position transmission under vehicle.

(3) Raise transmission until input shaft is centered in release bearing and clutch disc hub.

(4) Move transmission forward and start input shaft in release bearing, clutch disc and pilot bushing.

(5) Work transmission forward until seated against clutch housing. Do not allow transmission to remain unsupported after input shaft has entered clutch disc.

(6) Install and tighten transmission-to-clutch housing bolts to 108 N·m (80 ft. lbs.).

(7) Install transmission mount on transmission or rear crossmember.

(8) Install rear crossmember.

(9) Remove transmission jack and engine support fixture.

(10) Position transmission harness wires in clips on shift cover.

(11) Install clutch slave cylinder and install slave cylinder shield, if equipped.

(12) Connect speed sensor and backup light switch wires.

TWO WHEEL DRIVE

(1) Fill transmission with recommended lubricant. Correct fill level is bottom edge of fill plug hole.

(2) Align and install propeller shaft.

(3) Lower vehicle.

(4) Clean the mating surfaces of shift tower, isolator plate, and shift cover with suitable wax and grease remover.

(5) Apply Mopar Gasket Maker, or equivalent, to the sealing surface of the shift cover. Do not over apply sealant.

(6) Install the isolator plate onto the shift cover, metal side down.

(7) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(8) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.

(9) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(10) Install the shift lever extension onto the shift tower and lever assembly.

(11) Install shift boot and bezel.

(12) Connect battery negative cable.

FOUR WHEEL DRIVE

(1) Install transfer case shift mechanism on transmission.

(2) Install transfer case on transmission jack. Secure transfer case to jack with safety chains.

(3) Raise jack and align transfer case input gear with transmission mainshaft.

(4) Move transfer case forward and seat it on adapter.

(5) Install and tighten transfer case attaching nuts. Tighten nuts to 41–47 N·m (30–35 ft. lbs.) if case has 3/8 studs, or 30–41 N·m (22–30 ft. lbs.) if case has 5/16 studs.

(6) Install transfer case shift mechanism to side of transfer case.

(7) Connect transfer case shift lever to range lever on transfer case.

(8) Align and connect propeller shafts.

(9) Fill transmission with required lubricant. Check lubricant level in transfer case and add lubricant if necessary.

(10) Install transfer case skid plate, if equipped, and crossmember. Tighten attaching bolts/nuts to 41 N·m (30 ft. lbs.) torque.

(11) Install exhaust system components.

(12) Lower vehicle.

(13) Clean the mating surfaces of shift tower, isolator plate, and shift cover with suitable wax and grease remover.

(14) Apply Mopar Gasket Maker, or equivalent, to the sealing surface of the shift cover. Do not over apply sealant.

(15) Install the isolator plate onto the shift cover, metal side down.

(16) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(17) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.

MANUAL - NV4500 (Continued)

(18) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(19) Install the shift lever extension onto the shift tower and lever assembly.

(20) Install shift lever boot and bezel.

(21) Connect battery negative cable.

ADAPTER HOUSING SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Mark the propeller shafts and yokes for installation reference and remove the shafts.
- (3) Support transmission with a transmission jack.
- (4) Remove engine rear support. Refer to Group 9 Engine for procedures.
- (5) Remove transfer case.
- (6) Remove adapter housing seal with a pry tool or slide hammer mounted screw (Fig. 128).

Fig. 128 Adapter Housing - 4WD

- 1 - ADAPTER HOUSING
2 - SEAL

INSTALLATION

- (1) Install adapter housing seal with Installer C-3860-A and Handle C-4171.
- (2) Install transfer case.
- (3) Install propeller shafts with reference marks aligned.
- (4) Fill transfer case and transmission to proper level.
- (5) Remove support and lower vehicle.

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Mark the propeller shaft and yoke for installation reference.
- (3) Remove the propeller shaft.
- (4) On light duty 4X2 vehicles, remove extension housing seal (Fig. 129) using Remover C-3985-B.
- (5) On heavy duty 4X2 vehicles, remove extension housing seal with a pry tool or a slide hammer mounted screw.

Fig. 129 Extension Housing - 2WD

- 1 - EXTENSION HOUSING
2 - SEAL

- (6) On light duty transmissions, remove the extension housing bushing with Remover 6957.
- (7) On heavy duty transmissions, remove the extension housing bushing with Remover 8155.

INSTALLATION

- (1) On light duty transmissions, install housing bushing with Installer 6951 and Handle C-4171 (Fig. 130).

Fig. 130 Extension Housing Bushing

- 1 - HANDLE
2 - INSTALLER
3 - EXTENSION HOUSING

- (2) On heavy duty transmissions, install housing bushing with Installer 8156 and Handle C-4171.
- (3) On light duty transmissions, install housing seal with Installer C-3972-A and Handle C-4171 (Fig. 131).
- (4) On heavy duty transmissions, install housing seal with Installer 8154 and Handle C-4171.
- (5) Install propeller shaft with reference marks aligned.
- (6) Check and fill transmission.

EXTENSION HOUSING SEAL (Continued)

(7) Remove support and lower vehicle.

SHIFT MECHANISM**REMOVAL**

- (1) Remove transmission from vehicle.
(2) Remove shift cover bolts (Fig. 132).

80b171ee

Fig. 132 Shift Cover Bolts

- 1 - SHIFT COVER
2 - BOLTS (10)

(3) Loosen shift cover with pry tool. To avoid damaging cover seal surface, insert pry tool only in slots provided in cover (Fig. 133).

(4) Raise cover enough to disengage it from alignment dowels in gear case (Fig. 134).

(5) Raise front of shift cover and lift cover up and off gear case (Fig. 134).

J9221-82

FIFTH-REVERSE SHIFT FORK PADS

The plastic shift fork pads are held in place by a combination of tension and a small locating tang. Three pads are used on the fork (Fig. 135).

The pads can be removed either by hand or with a narrow blade screwdriver. To remove the pads by hand, grasp each pad and tilt it out and off the fork. If the pads prove difficult to remove by hand, insert a screwdriver blade between the pad and fork and pry the pad off.

SHIFT MECHANISM (Continued)

**Fig. 135 Shift Fork Pad Locations**

- 1 - SHIFT FORK PADS
2 - FIFTH-REVERSE FORK

EXPANSION PLUG

The expansion plugs at the rear of the shift rail bores (Fig. 136) can be replaced if loose and/or leaking.

**Fig. 136 Expansion Plug Location**

- 1 - EXPANSION PLUGS

- (1) Drill 6 mm (1/4 in.) diameter hole in center of each plug to be removed.
- (2) Pry plug out of cover with tapered punch.
- (3) Clean all chips from shift cover and plug bores. Then clean plug bores with solvent and dry with clean shop towel.

INSTALLATION**EXPANSION PLUG**

- (1) Apply small bead of sealer to outer edge of each new plug. Use Mopar® silicone adhesive/sealer, or equivalent.
- (2) Position each new plug in bore and tap into place with hammer and suitable size punch or socket.

FIFTH-REVERSE SHIFT FORK PADS

- (1) Align pad locating tab.
- (2) Snap pads into place and verify locating tabs are locked-in.

SHIFT COVER

- (1) Clean mating surfaces of shift cover and gear case with wax and grease remover.
- (2) Apply Mopar® Silicone Sealer, or equivalent, to sealing surface of shift cover or gear case. Do not over-apply sealer material. Excess can be squeezed into gear case and could block lubricant feed holes in time.
- (3) Lubricate synchro sleeves with Castrol Syntorq gear lubricant. Then apply light coat of petroleum jelly to shift fork contact surfaces.
- (4) Verify that the shift fork pads (Fig. 137) are properly and securely positioned on the fifth-reverse fork

**Fig. 137 Fifth-Reverse Shift Fork Pads**

- 1 - SHIFT FORK PADS
2 - FIFTH-REVERSE FORK

- (5) Verify that 1-2 and 3-4 synchro sleeves are in neutral position. Also verify that forks in shift cover are in neutral position.
- (6) Align and install shift cover. If cover will not seat, it is either not aligned on gear case dowels, or shift forks are not aligned with sleeves and shift lug.
- (7) Apply Mopar® Lock N' Seal, or equivalent, to threads of shift cover bolts.
- (8) Install and tighten shift cover bolts to 27-31 N·m (216-276 in. lbs.).
- (9) Install backup lamp switch and gasket in cover. Apply sealer to switch threads before installation and tighten switch to 22-34 N·m (193-265 in. lbs.).
- (10) Install vent assembly, if removed. Apply an adhesive/sealer to vent tube to help secure it in cover.
- (11) Install transmission.

SHIFT COVER

REMOVAL

- (1) Shift transmission into Neutral.
- (2) Unscrew and remove the shift lever extension from the shift
- (3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.
- (4) Remove the bolts holding the shift tower to the isolator plate and transmission shift cover.
- (5) Remove the shift tower and isolator plate from the transmission shift cover.

INSTALLATION

- (1) Clean the mating surfaces of shift tower, isolator plate, and shift cover with suitable wax and grease remover.

(2) Apply Mopar® Gasket Maker, or equivalent, to the sealing surface of the shift cover. Do not over apply sealant.

(3) Install the isolator plate onto the shift cover, metal side down.

(4) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(5) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.

(6) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(7) Install the shift lever extension, shift boot, and bezel.

MANUAL - NV5600

DESCRIPTION

The NV5600 is a six speed constant mesh manual transmission (Fig. 1). All gear ranges including reverse are synchronized. First and second gears utilize dual cone synchronizers in order to aid shifting.

Sixth gear is an overdrive range. The transmission uses cast iron for the gear case and extension/adapter housing and aluminum for the clutch housing.

The transmission is a end loader transmission. The shift lever is located in a shifter tower which is bolted to the gear case and operates the shift shaft.

MANUAL - NV5600 (Continued)

SHIFT PATTERN

The shift pattern is in a modified H pattern (Fig. 2). Overdrive fifth and sixth gears are in line and outboard of the first through fourth gear positions. Reverse gear is to the right of fifth and sixth and forward of the neutral gate.

**Fig. 2 Shift Pattern****GEAR RATIOS**

GEAR	RATIO
FIRST	5.63:1
SECOND	3.38:1
THIRD	2.04:1
FOURTH	1.39:1
FIFTH	1.00:1
SIXTH	0.73:1
REVERSE	5.63:1

IDENTIFICATION

The transmission has two identification tags attached to the driver side upper clutch housing (Fig. 3).

One tag provides the transmission part number. The second tag provides sequencing and build date information. The information on the tags are essential to correct parts ordering.

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point, all the transmission gears are spinning.

**Fig. 3 Identification Tag Location**

1 - IDENTIFICATION TAGS

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

DIAGNOSIS AND TESTING - MANUAL TRANSMISSION**LOW LUBRICANT LEVEL**

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer.

MANUAL - NV5600 (Continued)

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL

NOTE: Use a heavy duty scissors style transmission jack for remove of the transmission.

- (1) Disconnect battery negative cable.
- (2) Shift transmission into Neutral.
- (3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.

(4) Remove the bolts holding the shift tower to the isolator plate and transmission gear case.

(5) Remove the shift tower and isolator plate from the transmission gear case.

(6) Raise and support vehicle.

(7) Remove skid plate, if equipped.

(8) Mark propeller shaft/shafts and axle yokes for installation reference.

(9) Remove propeller shaft.

(10) Disconnect and remove exhaust system as necessary.

(11) Disconnect wires at backup light switch.

(12) Support engine with adjustable safety stand and wood block.

(13) If transmission is to be disassembled for repair, remove drain bolt at bottom of PTO cover and drain lubricant from transmission (Fig. 4).

Fig. 4 NV5600 Drain Bolt

1 - PTO COVER

2 - DRAIN BOLT

(14) Remove clutch slave cylinder splash shield, if equipped.

(15) Remove clutch slave cylinder bolts and move cylinder aside for clearance.

(16) Remove wire harness from clips on transmission.

TWO WHEEL DRIVE

(1) Remove bolts/nuts mounting transmission to the rear mount.

(2) Support and secure transmission with safety chains to a transmission jack.

(3) Remove rear crossmember.

(4) Remove transmission clutch housing bolts at the engine block.

(5) Slide transmission and jack rearward until input shaft clears clutch disc and pressure plate.

(6) Lower transmission jack and remove transmission from under vehicle.

MANUAL - NV5600 (Continued)

FOUR WHEEL DRIVE

- (1) Disconnect transfer case shift linkage at transfer case range lever.
- (2) Support and secure transfer case with safety chains to a transmission jack.
- (3) Remove transfer case mounting nuts.
- (4) Move transfer case rearward until input gear clears transmission mainshaft.
- (5) Lower transfer case assembly and move it from under vehicle.
- (6) Support and secure transmission with safety chains to a transmission jack.
- (7) Remove bolts/nuts attaching transmission mount to rear crossmember.
- (8) Remove rear crossmember.
- (9) Remove transmission clutch housing bolts at the engine block.
- (10) Move transmission rearward until input shaft clears clutch disc.
- (11) Lower transmission and remove it from under vehicle.

DISASSEMBLY

NOTE: The use of Fixture 8241 for moving and handling the NV5600 is required. The fixture supports the transmission at the center of gravity in order to ease mounting the transmission into the build fixture.

- (1) Using Fixture 8241, mount the transmission into the Build Fixture 8230 (Fig. 5).
- (2) Rotate the transmission to the horizontal position, if necessary.
- (3) Remove the shift tower (Fig. 6) and isolator plate (Fig. 7).
- (4) Remove primary shift rail detent plug (Fig. 8).
- (5) Remove primary shift rail detent spring (Fig. 9).
- (6) Remove primary shift rail detent plunger (Fig. 10).
- (7) Remove clutch housing bolts (10) (Fig. 11) from inside the housing.
- (8) Remove shift rail blocker bolt (Fig. 12) from the side of the transmission gear case.

EXTENSION/ADAPTER HOUSING

(1) Remove bolts holding the extension/adapter housing onto the transmission gear case.

(2) Remove extension/adapter housing from the transmission gear case with Puller 8244 (Fig. 13).

NOTE: It may be necessary to straighten the housing during removal due to the tendency for the reverse idler shaft to bind into one side of the housing.

80a2e76a

2 - EXTENSION/ADAPTER HOUSING

(3) Remove crossover detent plug, spring and plunger from the extension/adapter housing (Fig. 14).

(4) Remove bolt and washer holding the crossover cam to the extension/adapter housing (Fig. 15).

(5) Remove crossover cam from the extension/adapter housing.

(6) Remove back-up lamp switch and gasket from the extension/adapter housing.

(7) Remove countershaft rear bearing race from the extension/adapter housing with Remover L-4518 (Fig. 16).

(9) Remove reverse gear, reverse gear synchronizer cone, reverse gear outer blocker ring and reverse gear bearing (Fig. 24).

809f4ceb

Fig. 24 REVERSE GEAR COMPONENTS

- 1 - REVERSE GEAR
2 - REVERSE BEARING
3 - BLOCKER RING
4 - FRICTION CONE

(10) Remove reverse gear bearing sleeve from the output shaft (Fig. 25).

NOTE: If necessary heat the sleeve slightly with a heat gun. Do not use a torch to heat the sleeve or damage to the output shaft may occur.

(11) Remove roll-pin securing the reverse shift fork to the reverse shift rail. Use a 6mm (7/32 inch) punch and hammer.

(12) Remove reverse shift fork and synchronizer as an assembly from the reverse shift rail and the output shaft (Fig. 26).

MANUAL - NV5600 (Continued)

**Fig. 25 REVERSE BEARING SLEEVE**

1 - REVERSE GEAR BEARING SLEEVE

**Fig. 26 REVERSE SHIFT FORK**1 - REVERSE SYNCHRO
2 - REVERSE SHIFT FORK**TRANSMISSION GEAR CASE**

- (1) Remove remaining bolts holding the transmission gear case to the clutch housing.
- (2) Remove the shift socket roll pin with a 6mm (7/32 inch) punch and hammer.

(3) Install Fixture 8232 to the transmission gear case.

(4) Attach an engine crane or equivalent to Fixture 8232 and remove the transmission gear case from the clutch housing (Fig. 27).

**Fig. 27 TRANSMISSION LIFT**1 - FIXTURE 8232
2 - TRANSMISSION CASE

(5) Remove rear output shaft and countershaft bearing races from the transmission gear case with a brass drift and hammer.

GEARTRAIN

(1) Remove bolts holding the 5-6 crossover bracket to the clutch housing (Fig. 28).

(2) Attach Fixture 8232 to the output shaft and countershaft (Fig. 29).

(3) Attach an engine crane or equivalent to Fixture 8232 and raise the geartrain approximately 1/4 in. from the clutch housing.

(4) Remove 5-6 crossover bracket from the clutch housing.

(5) Lower the geartrain back into the clutch housing.

(6) Install Holding Tool 8242 (Fig. 30) onto the 5-6 synchro and tighten the screw to hold the 5-6 synchro together during the removal operation.

NOTE: Pay attention to the order of the shift fork arms at the primary shift rail when they are in the Neutral position.

MANUAL - NV5600 (Continued)**Fig. 28 5-6 CROSSOVER**

1 - 5-6 CROSSOVER BRACKET

**Fig. 29 ATTACH FIXTURE 8232**

1 - FIXTURE 8232

(7) Raise geartrain and shift rails until all the shift rails clear the clutch housing.

**Fig. 30 HOLDING TOOL 8242**

1 - HOLDING TOOL 8242
2 - 5-6 SYNCHRO

(8) Remove shift rails from the rest of the geartrain (Fig. 31).

**Fig. 31 SHIFT RAILS**

1 - SHIFT RAILS

(9) Raise the geartrain until the input shaft is clear of the clutch housing.

MANUAL - NV5600 (Continued)

(10) Remove geartrain from the clutch housing and install the geartrain into Support Stand 8246 (Fig. 32).

80b6b330

Fig. 32 LIFT GEARTRAIN WITH ENGINE CRANE

1 - FIXTURE 8232

2 - SUPPORT STAND 8246

(11) Remove Fixture 8232 from the output shaft and the countershaft.

(12) Separate the countershaft from the output shaft.

(13) Separate the output shaft from the input shaft. Hold the 5-6 synchro together while removing the output shaft to prevent the synchro sleeve from being dislodged from the synchro hub.

COUNTERSHAFT BEARINGS

(1) Remove snap-ring holding the front countershaft bearing onto the countershaft.

(2) Remove front countershaft bearing with Sleeve 6444-8, Adapters 6451, Puller Rods 6444-4 and Puller 6444 (Fig. 33).

(3) Remove rear countershaft bearing with Sleeve 6444-8, Adapters 6447, Puller Rods 6444-4, Puller 6444 and suitable press button (Fig. 34).

80b6b331

(3) Remove output shaft pocket bearing race from the input shaft with Puller L-4518 (Fig. 38).

80b6b339

Fig. 38 OUTPUT SHAFT POCKET BEARING

- 1 - PULLER L-4518
2 - INPUT SHAFT

(4) Remove input shaft bearing and oil guide from the input shaft with Sleeve 6444-8, Adapters 8243, Puller Rods 6444-6 and the remainder of Puller 6444 (Fig. 39).

OUTPUT SHAFT

NOTE: Some gear and synchro components can be installed backwards. To avoid assembly problems, mark the gears, clutch gears, synchro hubs, and sleeves for reference during teardown. Use paint or a scribe for marking purposes. Then stack the geartrain parts in order of removal. This practice will help avoid incorrect assembly.

- (1) Remove first gear from the output shaft.
- (2) Remove first gear bearing from the output shaft (Fig. 40).
- (3) Remove first gear blocker rings (2) and cones from the 1-2 synchro assembly (Fig. 41).
- (4) Install the remainder of the output shaft into Fixture 8227 with press blocks under second gear.
- (5) Install shaft and Fixture assembly into a shop press (Fig. 42).
- (6) Press second gear, 1-2 synchro assembly and first gear bearing sleeve from the output shaft.
- (7) Remove second gear bearing from the output shaft.

80b6b33a

Fig. 39 INPUT SHAFT BEARING

- 5 - 5-6 SYNCRO

COUNTERSHAFT

(1) Install the countershaft into Fixture 8227 with press blocks located under the fifth countershaft gear.

(2) Place the assembly into a shop press.

(3) Use Guide 8235 on end of countershaft and press the countershaft fifth gear from the countershaft (Fig. 44).

(4) Place countershaft in Fixture 8227 with press blocks placed under the sixth countershaft gear.

(5) Use Guide 8235 on end of countershaft and press the countershaft sixth gear from the countershaft (Fig. 45).

(6) Remove countershaft from the press and Fixture 8227.

MANUAL - NV5600 (Continued)

**Fig. 44 FIFTH COUNTERSHAFT GEAR**

- 2 - FOURTH GEAR BEARING
- 3 - COUNTERSHAFT
- 4 - FOURTH GEAR FRICTION CONE
- 5 - FOURTH COUNTERSHAFT GEAR

(8) Install countershaft into Fixture 8227 with press blocks located under the third countershaft gear

(9) Place assembly into a shop press and press third countershaft gear, 3-4 synchro, and fourth countershaft gear bearing sleeve from the countershaft (Fig. 47).

(10) Remove countershaft from the press and Fixture 8227.

(11) Remove third countershaft gear bearing from the countershaft (Fig. 48).

(12) The 2-3 thrust washer should not normally need to be removed from the countershaft. If necessary slid 2-3 thrust washer off countershaft.

MANUAL - NV5600 (Continued)**Fig. 47 THIRD COUNTERSHAFT GEAR**

- 2 - INPUT SHAFT OIL SEAL

CLEANING - TRANSMISSION

Clean the gears, bearings shafts, extension/adaptor housing and gear case with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

Run a tap through the gear case bolt holes if the threads need minor cleanup. Helicoil inserts can be used to repair seriously damaged threaded holes if necessary.

INSPECTION - TRANSMISSION

Inspect the reverse idler gear, bearings, shaft and thrust washers. Replace the bearings if the rollers are worn, chipped, cracked, flat-spotted or brinnelled. Or if the bearing cage is damaged or distorted. Replace the thrust washers if cracked, chipped or worn. Replace the gear if the teeth are chipped, cracked or worn thin.

Inspect the drive gear and bearings. Minor scratches and burrs on the gear surfaces can be reduced with an oil stone and 400 grit paper wetted with oil. Replace either bearing if worn, or damaged. Replace the gear if any teeth, splines, or bearing surfaces are also worn or damaged.

Inspect the front bearing retainer and bearing cup. Replace the bearing cup if scored, cracked, brinnelled or rough. Check the release bearing slide surface of the retainer carefully. Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth. Wet the abrasive paper

MANUAL - NV5600 (Continued)

and crocus cloth with oil when smoothing/polishing. Replace the retainer if worn or damaged in any way. Do not reuse original retainer bolts. Install new bolts during assembly.

Inspect the countershaft and bearings. Replace the bearings if worn, rough, flat spotted or heat checked. Check the countershaft gear teeth carefully. Small nicks, scratches or burrs can be removed with an oil stone and 400 grit paper wetted with oil. Replace the shaft if any of the teeth are worn, cracked, broken or severely chipped.

Be sure to check condition of the countershaft bearing cups. Replace either bearings cup if worn, or damaged.

Check condition of the mainshaft. Inspect all the bearing surfaces, splines and threads. Also check condition of the snap ring grooves in the hub area and the speedometer drive gear teeth. Minor scratches or burrs can be removed with an oil stone and polished with crocus cloth. However, replace the shaft if any surfaces exhibit considerable wear or damage.

Check condition of the gear case and extension or adapter housing. Be sure the alignment dowels in the case top surface and in the housing/adapter are tight and in good condition.

Run a tap through the gear case bolt holes if the threads need minor cleanup. Helicoil inserts can be used to repair seriously damaged threaded holes if necessary.

Be sure all case and housing/adapter sealing and mating surfaces are free of burrs and nicks. This is especially important as gaskets are not used in the transmission. Minor nicks and scratches on the sealing surfaces can be dressed off with a fine tooth file or oil stone.

Replace the gear case or housing/adapter if cracked or broken. Do not attempt to repair this type of damage by welding or brazing.

Check condition of the countershaft fifth gear components. This includes the shift lug and rail located in the gear case and the rail bushings.

Inspect the gear and hub assembly. Minor burrs can be cleaned up with an oil stone. However, the gear and hub assembly should be replaced if the teeth or splines are excessively worn, or damaged. The synchro sleeve should also be replaced if worn or damaged in any way. Do not reuse synchro struts that are worn or springs that are collapsed or severely distorted. Replace worn distorted synchro parts to avoid shift problems after assembly and installation.

The shift fork should be inspected for evidence of wear and distortion. Check fit of the sleeve in the fork to be sure the two parts fit and work smoothly. Replace the fork if the roll pin holes are worn over-size or damaged. Do not attempt to salvage a worn

fork. It will cause shift problems later on. Replace shift fork roll pins if necessary or if doubt exists about their condition.

The bearings should be examined carefully for wear, roughness, flat spots, pitting or other damage. Replace the bearings if necessary.

Inspect the blocker ring and clutch gear. replace either part if worn or damaged in any way. Also be sure replacement parts fit properly before proceeding with assembly.

Examine the 1-2 synchro hub and sleeve for wear or damage. Replace sleeve and hub if the splines are worn, chipped or damaged.

Replace the synchro struts if worn, or chipped. Also replace the springs if collapsed, distorted or broken.

Inspect the mainshaft geartrain components. Check teeth on all gears, hubs, clutch gears, stop rings and clutch rings. The teeth must be in good condition and not worn, cracked or chipped. Replace any component that exhibits wear or damage.

Examine the synchro stop rings, clutch rings and clutch gears. Replace any part that exhibits wear, distortion or damage. Replace the clutch rings if the friction material is burned, flaking off or worn.

Inspect all of the thrust washers and locating pins. Replace the pins if bent or worn. Replace the washers if worn or the locating pin notches are distorted.

Check condition of the synchro struts and springs. Replace these parts if worn, cracked or distorted.

ASSEMBLY

NOTE: Gaskets are not used in the transmission. Use Mopar® Gasket Maker or equivalent on all gear case and extension housing sealing surfaces.

OUTPUT SHAFT

(1) Place second gear on bench with the synchro clutch ring up.

(2) Install second gear synchro inner blocker ring onto second gear (Fig. 53).

(3) Install second gear synchro friction cone over the blocker ring and onto second gear (Fig. 54).

(4) Install second gear synchro outer blocker ring over the second gear synchro friction cone. Align one of the lugs on the outer ring with a lug on the inner ring (Fig. 55).

(5) Install 1-2 synchro assembly onto the second gear assembly (Fig. 56).

(6) Reverse assembly on the bench.

MANUAL - NV5600 (Continued)

(7) Install second gear bearing into second gear (Fig. 57).

Fig. 57 Second Gear Bearing

1 - BEARING
2 - GEAR

(8) Place completed 1-2 synchro, second gear and second gear bearing to a shop press with second gear facing upward.

(9) Install output shaft into the second gear 1-2 synchro assembly with the front of the output shaft facing upward (Fig. 58).

(10) Press the output shaft into position.

Fig. 58 Output Shaft Into 1-2 Synchro

1 - OUTPUT SHAFT
2 - 1-2 SYNCHRO
3 - SECOND GEAR

(11) Place first gear on bench with the synchro clutch ring up.

(12) Install first gear synchro inner blocker ring onto first gear (Fig. 53).

(13) Install first gear synchro friction cone over the blocker ring and onto first gear (Fig. 54).

(14) Install first gear synchro outer blocker ring over the first gear synchro friction cone. Align one of the lugs on the outer ring with a lug on the inner ring (Fig. 55).

(15) Reverse the output shaft in the press.

(16) Install first gear bearing sleeve onto the output shaft.

(17) Install first gear bearing sleeve the remainder of the way onto the output shaft using Installer 8228 and a shop press (Fig. 59).

Fig. 59 First Gear Bearing Sleeve

1 - INSTALLER 8228
2 - FIRST GEAR BEARING SLEEVE

(18) Install first gear and blocker assembly onto the output shaft (Fig. 60).

(19) Install first gear bearing over the output shaft and into first gear.

(20) Install output shaft thrust washer onto the output shaft (Fig. 61).

MANUAL - NV5600 (Continued)

2 - OUTPUT SHAFT THRUST WASHER

(21) Install rear output shaft bearing onto the output shaft with Installer 8228 and a shop press (Fig. 62).

(22) Install a **new** snap-ring to hold the rear output bearing onto the output shaft. Select and install the thickest snap-ring which will fit into the groove.

**Fig. 62 Rear Output Shaft Bearing**

- 1 - INSTALLER 8228
2 - REAR OUTPUT SHAFT BEARING

(23) Reverse output shaft in the Fixture 8227 and support the shaft with press blocks under first gear.

(24) Install sixth gear bearing onto the output shaft.

(25) Install sixth gear onto the output shaft and over the sixth gear bearing (Fig. 63).

(26) Install the sixth gear friction cone onto sixth gear.

(27) Install sixth gear blocker ring over the sixth gear friction cone (Fig. 64).

(28) Install Guide 8235 onto the end of the output shaft (Fig. 65).

(29) Install 5-6 synchro over Guide 8235 and onto the output shaft (Fig. 66).

(30) Press 5-6 synchro onto the output shaft with Installer 8156 and a shop press.

(31) Install output shaft pocket bearing onto the output shaft.

**Fig. 63 Sixth Gear**

MANUAL - NV5600 (Continued)

(32) Press pocket bearing the remainder of the way onto the output shaft using Guide 8235 and a shop press (Fig. 67).

Fig. 67 Output Shaft Pocket Bearing

1 - GUIDE 8235

2 - POCKET BEARING

(33) Install a **new** snap-ring to hold the output shaft pocket bearing onto the output shaft.

COUNTERSHAFT

(1) Place third countershaft gear on the bench with the synchro clutch ring up.

(2) Install third countershaft gear friction cone onto third gear (Fig. 68).

(3) Install third countershaft gear blocker ring onto the friction cone (Fig. 69).

(4) Install 3-4 synchro assembly onto the blocker ring/gear assembly (Fig. 70).

(5) Reverse the assembly on the bench.

(6) Install third countershaft gear bearing into the third countershaft gear.

(7) Install 2-3 thrust washer onto the countershaft.

(8) Place third gear/3-4 synchro assembly in a shop press.

(9) Install countershaft through the third gear/3-4 synchro assembly.

(10) Press countershaft into the 3-4 synchro assembly (Fig. 71).

(11) Install fourth countershaft gear bearing sleeve onto the output shaft.

(12) Press fourth countershaft bearing sleeve onto the countershaft with Installer 8228 and a shop press.

Fig. 68 Friction Cone Onto Gear

1 - FRICTION CONE

2 - GEAR

3 - CLUTCH RING

Fig. 69 Blocker Ring Onto Friction Cone

1 - BLOCKER RING

2 - GEAR

3 - FRICTION CONE

(13) Place fourth countershaft gear on the bench with the synchro clutch ring up.

(14) Install fourth countershaft gear friction cone onto fourth countershaft gear (Fig. 68).

(15) Install fourth countershaft gear blocker ring onto the friction cone (Fig. 69).

(16) Install fourth countershaft gear bearing into the fourth countershaft gear.

(17) Place sixth countershaft gear in the shop press.

(18) Position fourth countershaft gear assembly onto the sixth countershaft gear (Fig. 72).

(19) Install countershaft into the fourth/sixth countershaft gear assembly in the shop press.

MANUAL - NV5600 (Continued)

3 - THIRD COUNTERSHAFT GEAR

(20) Press countershaft into sixth gear (Fig. 73).
(21) Place fifth countershaft gear into the shop press.

**Fig. 73 Countershaft To Sixth Countershaft Gear**

- 1 - COUNTERSHAFT
2 - 6TH COUNTERSHAFT GEAR
3 - 3-4 SYNCHRO

MANUAL - NV5600 (Continued)

(22) Install countershaft into the fifth countershaft gear and press countershaft into fifth gear (Fig. 74).

CAUTION: Gear and shaft must be aligned while pressing or the gear will bind on the shaft.

Fig. 74 Countershaft to Fifth Countershaft Gear

- 1 - COUNTERSHAFT
2 - 5TH COUNTERSHAFT GEAR

(23) Place front countershaft bearing onto the countershaft.

(24) Install front countershaft bearing onto the countershaft with Installer 8236 and Handle C-4171.

(25) Install a **new** snap-ring to hold the front countershaft bearing onto the countershaft.

(26) Place rear countershaft bearing onto the countershaft.

INPUT SHAFT

(1) Place the input shaft bearing onto the input shaft.

(2) Install input shaft bearing with Installer MD998805 (Fig. 75).

Fig. 75 Input Shaft Bearing

- 1 - INSTALLER MD998805
2 - INPUT SHAFT BEARING

(3) Position the input shaft bearing oil guide on the input shaft (Fig. 76).

(4) Install input shaft bearing oil guide with Installer MD998805.

(5) Place the output shaft pocket bearing race in the input shaft.

(6) Install output shaft pocket bearing race into the input shaft with Installer C-4628 and Handle C-4171 (Fig. 77).

80b6b361

Fig. 76 Input Shaft Oil Guide

- 1 - INPUT SHAFT
2 - INPUT SHAFT OIL GUIDE

CLUTCH HOUSING

(1) Install input shaft bearing race so that the bearing race protrudes 0.3 in. above the front surface of the clutch housing. Install bearing race with Remover/Installer 8237 and Handle C-4171.

(2) Install countershaft front bearing race into the clutch housing so that the bearing race protrudes 0.4 in. above the front surface of the clutch housing. Install bearing race with Remover 6061-1 and Handle C-4171.

(3) Install countershaft oil guide and spacer into the countershaft front bearing bore in the clutch housing (Fig. 78).

(4) Clean all old sealer from the input shaft retainer and the clutch housing but **DO NOT** apply new sealer at this time. New sealer will be applied after all the preload measurements are made and end-play shims are installed.

NOTE: Do not replace the input shaft seal at this time. A new seal will be installed after all the preload measurements are made and endplay shims are installed.

80b6b35f

3 - INSTALLER C-4628

80b6b362

Fig. 78 Oil Guide and Spacer

- 1 - 0.3 IN BEYOND FLUSH
2 - 0.4 IN BEYOND FLUSH

(5) Install input shaft retainer onto the clutch housing and install bolts to hold the input shaft retainer.

MANUAL - NV5600 (Continued)

GEARTRAIN

- (1) Install input shaft into Support Stand 8246.
- (2) Install fifth gear friction cone onto the input shaft.
- (3) Install fifth gear blocker ring onto the fifth gear friction cone.
- (4) Install output shaft into the input shaft (Fig. 79).

80b6b363

Fig. 79 Install Output Shaft to Input Shaft

- 1 - OUTPUT SHAFT
- 2 - INPUT SHAFT
- 3 - SUPPORT STAND 8246

(5) Install countershaft into the Support Stand 8246 and verify that all gears are meshed with their mates on the mainshaft (Fig. 80).

(6) Install Fixture 8232 to the output shaft and the countershaft.

(7) Install Holding Tool 8242 onto the 5-6 synchro and tighten the screw to hold the 5-6 synchro together during the remainder of the installation procedure.

80b6b364

Fig. 80 Countershaft to Mainshaft

- 1 - COUNTERSHAFT
- 2 - OUTPUT SHAFT
- 3 - SUPPORT STAND 8246

(8) Attach an engine crane or equivalent to Fixture 8232 and move the geartrain from the Support Stand 8246 to the clutch housing (Fig. 81).

(9) Install shift forks and rails onto the geartrain (Fig. 82).

NOTE: The closest shift arm to the geartrain is for Reverse. The next is 5-6, then 3-4 and then 1-2 when moving out from the geartrain.

(10) Install geartrain and shift rails into the clutch housing. Lower the geartrain and rails into the housing slowly while guiding input shaft through input shaft seal. Avoid any binds on the shift rails, forks and synchros as the rails enter their bushings.

CAUTION: Do not damage input shaft seal with the input shaft splines.

MANUAL - NV5600 (Continued)

80b6b330

- 1 - HOLDING TOOL 8242
2 - 5-6 SYNCHRO

80b6b32f

Fig. 82 Install Shift Rails

- 1 - SHIFT RAILS

(11) With the geartrain approximately 1/4 in. from the clutch housing, remove Holding Tool 8242 from the 5-6 synchro (Fig. 83).

(12) Install 5-6 crossover bracket and arm to the shift rails and the clutch housing.

(13) Lower geartrain the remainder of the way into the clutch housing.

(14) Install the 5-6 crossover bracket bolts (Fig. 84).

80b6b1c8

Fig. 84 5-6 Crossover Bracket Bolts

- 1 - 5-6 CROSSOVER BRACKET

(15) Remove engine crane and Fixture 8232 from the output shaft and the countershaft.

MANUAL - NV5600 (Continued)

TRANSMISSION GEAR CASE

(1) Install rear output shaft bearing race into the transmission gear case with Installer C-4308 and Handle C-4171.

(2) Install rear countershaft bearing race into the transmission gear case with Installer 8153 and Handle C-4171.

(3) Install Fixture 8232 to the transmission gear case.

NOTE: Shift socket must be loose on the shift shaft and is rotated a minimum of 90° from its normal position. This will ensure enough clearance to install the transmission gear case.

(4) Attach an engine crane or equivalent to Fixture 8232 and install the transmission gear case onto the clutch housing (Fig. 85).

80a2e762

Fig. 85 Transmission Gear Case

- 1 - FIXTURE 8232
2 - TRANSMISSION CASE

(5) Install clutch housing bolts and tighten to 48 N·m (35 ft.lbs.).

(6) Install shift socket roll pin with a suitable 6mm (7/32 inch) punch and hammer.

MAINSHAFT AND COUNTERSHAFT ENDPLAY

(1) With transmission in vertical position, use Socket 6993 to rotate the shafts and seat the bearings.

(2) Measure mainshaft endplay with Dial Indicator Set C-3339 and Extension Rod 8161 installed onto the rear of the transmission gear case (Fig. 86).

80b6b365

Fig. 86 Measure Mainshaft End-Play

- 1 - DIAL INDICATOR C-3339
2 - EXTENSION ROD 8161
3 - MAIN SHAFT

(3) Measure countershaft end-play with Dial Indicator Set C-3339 and Extension Rod 8161 installed onto the rear of the transmission gear case (Fig. 87).

(4) Rotate transmission into a horizontal position and remove the input shaft retainer.

(5) Install shims necessary to achieve an end-play of 0.051-0.15 mm (0.002-0.006 in.) for the mainshaft and countershaft.

NOTE: Countershaft shims go between the bearing race and spacer. Mainshaft shims go into the input shaft retainer.

MANUAL - NV5600 (Continued)

80b6b366

Fig. 87 Measure Countershaft End-Play

- 1 - EXTENSION ROD 8161
 2 - DIAL INDICATOR C-3339
 3 - COUNTERSHAFT

(6) Install a **new** input shaft seal into the input shaft retainer with Installer C-4965.

(7) Install input shaft oil guide with C-3972-A and Handle C-4171.

(8) Apply sealer to the input shaft retainer and install retainer onto the clutch housing. Install bolts and tighten to 28 N·m (20 ft.lbs.).

REVERSE GEAR

(1) Install reverse shift fork and synchronizer as an assembly onto the reverse shift rail and output shaft (Fig. 88).

NOTE: Raised square shoulder and snap-ring on the synchro face the case.

(2) Install roll-pin securing the reverse shift fork to the reverse shift rail with 6mm (7/32 in) punch and a hammer.

(3) Install reverse gear bearing sleeve onto the output shaft with Installer 6446 if necessary (Fig. 89).

(4) Install reverse gear, reverse gear synchronizer cone, reverse gear outer blocker ring, and reverse gear bearing (Fig. 90).

(5) Install output shaft ball bearing assembly and reverse thrust washer onto the output shaft (Fig. 91).

NOTE: Raised shoulder on thrust washer faces away from the reverse gear.

80b6b1c6

Fig. 88 Reverse Shift Fork and Synchro

- 1 - REVERSE SYNCHRO
 2 - REVERSE SHIFT FORK

80b6b1c5

Fig. 89 Reverse Bearing Sleeve

- 1 - REVERSE GEAR BEARING SLEEVE

(6) Install a **new** output shaft nut onto the output shaft.

(7) With Wrench 8226 on the output shaft nut and Socket 6993 or 6984 holding the output shaft, tighten the nut to 339 N·m (250 ft.lbs.).

MANUAL - NV5600 (Continued)

809f4ceb

Fig. 90 Reverse Gear Components

- 3 - BLOCKER RING
- 4 - FRICTION CONE

80b6b1c3

Fig. 91 Output Shaft Bearing and Thrust Washer

- 1 - OUTPUT SHAFT BALL BEARING
- 2 - THRUST WASHER

(8) Stake nut into the slot in the output shaft with a 9mm (5/16 in.) punch.

(9) Press countershaft reverse gear into the sleeve with a shop press.

(10) Install reverse countershaft rear bearing onto the countershaft reverse gear assembly with Installer C-4652 and Handle C-4171.

(11) Install reverse idler gear rear bearing, bearing spacer, front bearing, and front thrust washer onto the idler gear shaft.

(12) Install idler and reverse countershaft gears together (Fig. 92).

80c0713a

Fig. 92 Reverse Idler and Countershaft Gears

- 1 - REVERSE IDLER GEAR
- 2 - COUNTERSHAFT REVERSE GEAR

(13) Install reverse idler thrust washer from the reverse idler.

(14) Install crossover cam rollers and pin (Fig. 93).

80c07139

Fig. 93 Crossover Cam Rollers and Pin

- 1 - CROSSOVER CAM PIN
- 2 - CROSSOVER CAM ROLLERS

MANUAL - NV5600 (Continued)**EXTENSION/ADAPTER HOUSING**

(1) Install extension housing bushing with Installer 8156 and Handle C-4171, if necessary. The oil feed hole must be at the 12 o'clock position when installed.

(2) On 4X2 vehicles, install extension housing seal with Installer 8154 and Handle C-4171, with the weep hole at the bottom.

NOTE: Drain hole located in the dust boot portion of the seal must face downward (toward the ground) when installed.

(3) On 4X4 vehicles, install adapter housing seal with Installer C-3860-A and Handle C-4171.

(4) Install the crossover cam bushing into the extension/adapter housing with Installer 8239 and Handle C-4171.

(5) Clean the rear of the transmission case of all sealer.

(6) Install reverse countershaft gear bearing race onto the reverse countershaft gear bearing.

(7) Measure the distance from the back of the bearing race to Gauge Bar 6311 (Fig. 94).

80c0713b

Fig. 94 Measure Height of Reverse Countershaft

1 - MEASURE DISTANCE FROM RACE TO GAUGE BAR 6311

(8) Measure thickness of the gauge bar and record the total of the two measurements.

(9) Clean all the sealer from the extension/adapter housing.

(10) Place Gauge Bar 6311 across the housing face. Measure the distance from the top of the bar to the bottom of the reverse countershaft bearing race bore (Fig. 95).

80ba77f2

Fig. 95 Reverse Countershaft Gear Bearing Race Bore

1 - GAUGE BAR 6311 TO BEARING RACE BORE MEASUREMENT

(11) Subtract thickness of the gauge bar from the measurement and record the result.

(12) The difference between the two measurements is the end-play for the reverse countershaft gear assembly.

(13) Install shims to achieve 0.15-0.25 mm (0.006-0.010 in.) end-play for the reverse countershaft gear assembly into the reverse countershaft bearing race bore.

(14) Use Installer to install the reverse countershaft bearing race into the extension/adapter housing.

(15) Install back-up lamp switch and a new gasket into the extension/adapter housing. Tighten switch to 28 N·m (20 ft.lbs.).

(16) Install crossover cam into the extension/adapter housing.

(17) Install bolt to hold the crossover cam to the extension/adapter housing (Fig. 96).

MANUAL - NV5600 (Continued)

80c07138

Fig. 96 Crossover Cam

- 1 - CROSSOVER CAM
- 2 - BOLT
- 3 - EXTENSION HOUSING

(18) Install crossover detent plunger, spring and plug into the extension/adaptor housing. Tighten the plug to 47.5 N·m (35 ft.lbs.) (Fig. 97).

80b6b1b8

Fig. 97 Crossover Cam Detent Plug

- 1 - DETENT PLUG
- 2 - EXTENSION HOUSING

(19) Apply sealer to the surface of the transmission case.

(20) Install extension/adaptor housing onto the transmission case.

(21) Install bolts to hold the extension/adaptor housing onto the transmission gear case. Tighten bolts to 48 N·m (35 ft.lbs.).

(22) Install shift rail blocker bolt and tighten bolt to 55 N·m (41 ft.lbs.).

(23) Install primary shift rail detent plunger, spring and plug into the transmission case. Tighten detent plug to 47.5 N·m (35 ft.lbs.).

(24) Install shift tower onto the transmission case and tighten bolts to 9 N·m (7 ft.lbs.).

INSTALLATION

NOTE: If a new transmission is being installed, be sure to use all components supplied with the new transmission. For example, if a new shift tower is supplied with the new transmission, do not re-use the original shift tower.

NOTE: Use a heavy duty scissors style transmission jack to install the transmission.

Before installation apply light coat of Mopar high temperature bearing grease to contact surfaces of following components:

- input shaft splines.
- release bearing slide surface of front retainer.
- release bearing bore.
- release fork.
- release fork ball stud.
- propeller shaft slip yoke.

(1) Apply sealer to threads of bottom PTO cover bolt and install bolt in case.

(2) Mount transmission on jack and position transmission under vehicle.

(3) Raise transmission until input shaft is centered in clutch disc hub.

(4) Move transmission forward and start input shaft in clutch disc and pilot bushing/bearing.

(5) Work transmission forward until seated against engine block. Do not allow transmission to remain unsupported after input shaft has entered clutch disc.

(6) Install and tighten transmission-to-engine block bolts.

(7) Install clutch slave cylinder.

(8) Connect backup light switch wires.

(9) Fill transmission with recommended lubricant. Correct fill level is bottom edge of fill plug hole.

(10) Position transmission harness wires in clips on transmission.

(11) Install transmission mount on transmission or rear crossmember.

(12) Install rear crossmember.

(13) Remove transmission jack and engine support fixture.

TWO WHEEL DRIVE

(1) Install propeller shaft with reference marks aligned.

(2) Install exhaust system components.

(3) Remove support and lower vehicle.

(4) Shift transmission into third gear.

MANUAL - NV5600 (Continued)

(5) Clean the mating surfaces of shift tower and isolator plate with suitable wax and grease remover.

(6) Apply Mopar Gasket Maker or equivalent to sealing surface of the transmission case. Do not over apply sealant.

(7) Install isolator plate onto the transmission case metal side down.

(8) Install shift tower onto the isolator plate. No sealant is necessary between the shift tower and top of isolator plate.

(9) Verify that the shift tower, isolator plate and the shift socket are properly aligned.

(10) Install bolts to hold the shift tower to the isolator plate and the transmission case. Tighten bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(11) Install shift boot and bezel.

(12) Connect battery negative cable.

FOUR WHEEL DRIVE

(1) Install and secure transfer case on the transmission jack.

(2) Raise and align transfer case input gear with transmission mainshaft.

(3) Move transfer case forward and seat it on adapter.

(4) Install and tighten transfer case mounting nuts to 41-47 N·m (30-35 ft. lbs.) if case has 3/8 studs. If case has 5/16 studs tighten to 30-41 N·m (22-30 ft. lbs.).

(5) Connect transfer case shift lever to range lever on transfer case.

(6) Install propeller shafts with reference marks aligned.

(7) Fill transmission with required lubricant. Check lubricant level in transfer case and add lubricant if necessary.

(8) Install transfer case skid plate, if equipped, and crossmember. Tighten attaching bolts/nuts to 41 N·m (30 ft. lbs.).

(9) Install exhaust system components.

(10) Remove support and lower vehicle.

(11) Shift transmission into third gear.

(12) Clean the mating surfaces of shift tower, isolator plate, and transmission case with suitable wax and grease remover.

(13) Apply Mopar Gasket Maker or equivalent to the sealing surface of the transmission case. Do not over apply sealant.

(14) Install isolator plate onto the transmission case, metal side down.

(15) Install shift tower onto the isolator plate. No sealant is necessary between the shift tower and top of isolator plate.

(16) Verify that the shift tower, isolator plate and the shift tower bushings are properly aligned.

(17) Install the bolts to hold the shift tower to the isolator plate and the transmission case. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(18) Install shift lever boot and bezel.

(19) Connect battery negative cable.

Installer,

ADAPTER HOUSING SEAL

REMOVAL

- (1) Remove the propeller shaft.
- (2) Remove the transfer case.
- (3) Remove adapter housing seal with a pry tool or a slide hammer mounted screw.

INSTALLATION

- (1) Install extension housing seal with Installer 8154 and Handle C-4171.
- (2) Install propeller shaft with reference marks aligned.

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Mark propeller shaft and pinion yoke for installation reference and remove the propeller shaft.
- (3) Remove the extension housing seal with a suitable pry tool or a slide hammer mounted screw.
- (4) Remove the extension housing bushing with Remover 8155 (Fig. 98).

Fig. 98 Extension Housing

1 - REMOVER

INSTALLATION

- (1) Install extension housing bushing with Installer 8156 (Fig. 99) and Handle C-4171.
- (2) Install adapter housing seal with Installer 8154 and Handle C-4171 (Fig. 100).
- (3) Install transfer case and propeller shaft(s).
- (4) Check and fill transmission.
- (5) Remove support and lower vehicle.

INSTALLATION

- (1) Shift transmission into third gear.
- (2) Clean the mating surfaces of shift tower, isolator plate, and transmission gear case with suitable wax and grease remover.
- (3) Apply Mopar® Gasket Maker, or equivalent, to the sealing surface of the transmission. Do not over apply sealant.
- (4) Install the isolator plate onto the transmission, metal side down.
- (5) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and top of the isolator plate.
- (6) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.
- (7) Install the bolts to hold the shift tower to the isolator plate and the transmission gear case. Tighten the shift tower bolts to 8–10 N·m (7–9 ft. lbs.).
- (8) Install the shift lever extension, shift boot, and bezel.

AUTOMATIC TRANSMISSION - 42RE

DESCRIPTION

The 42RE is a four speed fully automatic transmission (Fig. 1) with an electronic governor. The 42RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the

low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

GEAR RATIOS The 42RE gear ratios are:

1st	2.74:1
2nd	1.54:1
3rd	1.00:1
4th	0.69:1
Rev.	2.21:1

OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 42RE (Continued)

PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

80c070a6

Fig. 3 Park Powerflow

- 1 - PAWL ENGAGED FOR PARK
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT

NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

- 4 - CAM
- 5 - PAWL

AUTOMATIC TRANSMISSION - 42RE (Continued)

REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from

the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

AUTOMATIC TRANSMISSION - 42RE (Continued)

FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to

the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

AUTOMATIC TRANSMISSION - 42RE (Continued)

SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed.

Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

AUTOMATIC TRANSMISSION - 42RE (Continued)

DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clock-wise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front

annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

AUTOMATIC TRANSMISSION - 42RE (Continued)

FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB® scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform hydraulic pressure test if shift problems were noted during road test.

(6) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CLUTCH AND BAND APPLICATION CHART

SHIFT LEVER POSITION	TRANSMISSION CLUTCHES AND BANDS					OVERDRIVE CLUTCHES		
	FRONT CLUTCH	FRONT BAND	REAR CLUTCH	REAR BAND	OVER- RUNNING CLUTCH	OVER- DRIVE CLUTCH	DIRECT CLUTCH	OVER- RUNNING CLUTCH
Reverse	X			X			X	
Drive - First			X		X		X	X
Drive - Second		X	X				X	X
Drive - Third	X		X				X	X
Drive - Fourth	X		X			X		
Manual Second		X	X		X		X	X
Manual First			X	X	X		X	X

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrunning braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

AUTOMATIC TRANSMISSION - 42RE (Continued)

Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

80b170e6

Fig. 9 Pressure Test Port Locations

- 1 - OVERDRIVE CLUTCH TEST PORT
- 2 - GOVERNOR TEST PORT
- 3 - ACCUMULATOR TEST PORT
- 4 - FRONT SERVO TEST PORT
- 5 - REAR SERVO TEST PORT

Test One - Transmission In Manual Low

NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.

- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two - Transmission In 2 Range

NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three - Transmission In D Range Third Gear

NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle

AUTOMATIC TRANSMISSION - 42RE (Continued)

lever forward and increase as lever is moved rearward.

- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

Test Four - Transmission In Reverse

NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

- (1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.
- (2) Move 300 psi Gauge C-3293-SP back to rear servo port.
- (3) Have helper start and run engine at 1600 rpm for test.
- (4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.
- (5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.
- (6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

Test Five - Governor Pressure

NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.

- (1) Move 100 psi Test Gauge C-3292 to governor pressure port.
- (2) Move transmission shift lever two detents rearward from full forward position. This is D range.
- (3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

- (4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

- (5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

- (6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

- (7) Compare results of pressure test with analysis chart.

Test Six - Transmission In Overdrive Fourth Gear

NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.

- (1) Remove tachometer; it is not needed for this test.
- (2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.
- (3) Lower vehicle.
- (4) Turn OD switch on.
- (5) Secure test gauge so it can be viewed from drivers seat.
- (6) Start engine and shift into D range.
- (7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.
- (8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.
- (9) Return to shop or move vehicle off chassis dyno.

PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

Fig. 10 Air Pressure Test Passages

- 1 - REAR SERVO APPLY
- 2 - FRONT SERVO APPLY
- 3 - PUMP SUCTION
- 4 - FRONT CLUTCH APPLY
- 5 - FRONT SERVO RELEASE
- 6 - LINE PRESSURE TO ACCUMULATOR
- 7 - PUMP PRESSURE
- 8 - TO CONVERTER
- 9 - REAR CLUTCH APPLY
- 10 - FROM CONVERTER
- 11 - TO COOLER

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage.

AUTOMATIC TRANSMISSION - 42RE (Continued)

Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 12).
- (2) Leaks at the converter hub weld (Fig. 12).

CONVERTER HOUSING AREA LEAK CORRECTION

- (1) Remove converter.
- (2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.
- (3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

J9021-35

Fig. 11 Converter Housing Leak Paths

- 4 - PUMP GASKET
- 5 - CONVERTER HOUSING
- 6 - CONVERTER
- 7 - REAR MAIN SEAL LEAK

RH254

Fig. 12 Converter Leak Points - Typical

- 1 - OUTSIDE DIAMETER WELD
- 2 - TORQUE CONVERTER HUB WELD
- 3 - STARTER RING GEAR
- 4 - LUG

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to

AUTOMATIC TRANSMISSION - 42RE (Continued)

plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts

DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Add Fluid
	2. Throttle Linkage Mis-adjusted.	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose.	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken.	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect.	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect.	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Mis-adjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter and flush cooler and line before installing new converter.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Mis-adjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump).	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Mis-adjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB® scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Transfer case failure can plug cooler.
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Mis-adjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB® scan tool and repair as required.
	8. Front Band Mis-adjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Mis-adjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Mis-adjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn.	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Circuit Electrical Fault.	1. Test with DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Mis-adjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB® scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	6. TPS Malfunction.	6. Replace sensor, check with DRB® scan tool.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Mis-adjusted/ Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor Component Electrical Fault.	3. Check operating pressures and test with DRB® scan tool, repair faulty component.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Mis-adjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Mis-assembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Mis-assembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking.	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage.
	3. Rear Band Mis-adjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Overdrive Direct Clutch Worn.	5. Disassemble overdrive. Repair as needed.
	6. Hydraulic Pressure Too Low.	6. Perform hydraulic pressure tests to determine cause.
	7. Rear Servo Leaking.	7. Air pressure check clutch-servo operation and repair as required.
	8. Band Linkage Binding.	8. Inspect and repair as required.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage.
	4. Gearshift Linkage Mis-adjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines.	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR "D" ONLY, BUT NOT IN MANUAL 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Mis-adjusted.	8. Adjust bands.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Mis-adjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required.
NO 4-3 DOWNSHIFT	1. Circuit Wiring and/or Connectors Shorted.	1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required.
	2. PCM Malfunction.	2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty.
	3. TPS Malfunction	3. Check TPS with DRB® scan tool at PCM.
	4. Lockup Solenoid Not Venting.	4. Remove valve body and replace solenoid assembly if plugged or shorted.
	5. Overdrive Solenoid Not Venting.	5. Remove valve body and replace solenoid if plugged or shorted.
	6. Valve Body Valve Sticking.	6. Repair stuck 3-4 shift valve or lockup timing valve.
NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF	1. Control Switch Open/Shorted.	1. Test and replace switch if faulty.
	2. Overdrive Solenoid Connector Shorted.	2. Test solenoids and replace if seized or shorted.
	3. PCM Malfunction.	3. Test with DRB® scan tool. Replace PCM if faulty.
	4. Valve Body Stuck Valves.	4. Repair stuck 3-4, lockup or lockup timing valve.
CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT	1. Transmission Fluid Low.	1. Add Fluid.
	2. Throttle Cable Mis-adjusted.	2. Adjust cable.
	3. Overdrive Clutch Select Spacer Wrong Spacer.	3. Replace overdrive piston thrust plate spacer.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT	1. Overdrive Solenoid Connector or Wiring Shorted.	1. Test connector and wiring for loose connections, shorts or ground and repair as needed.
	2. TPS Malfunction.	2. Test TPS and replace as necessary. Check with DRB® scan tool.
	3. PCM Malfunction.	3. Test PCM with DRB® scan tool and replace controller if faulty.
	4. Overdrive Solenoid Malfunction.	4. Replace solenoid.
	5. Valve Body Malfunction.	5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.
NO 3-4 UPSHIFT	1. O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB® scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB® scan tool and replace if necessary.
	6. Neutral Sense to PCM Wire Shorted/Cut.	6. Test switch/sensor as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Mis-adjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB® scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance.	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Mis-adjusted.	1. Adjust linkage/cable.
	2. Neutral Sense Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Park/Neutral Switch, or Transmission Range Sensor Faulty.	3. Refer to service section for test and replacement procedure.
	4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Mis-adjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.
OIL LEAKS.	1. Fluid Lines and Fittings Loose/ Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose Loose/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	11. Pump Seal Leaks/Worn/Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

- (1) Disconnect battery negative cable.
- (2) Disconnect and lower or remove necessary exhaust components.
- (3) Remove engine-to-transmission struts, if equipped (Fig. 13).
- (4) Disconnect fluid cooler lines at transmission.
- (5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- (6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.
- (7) Remove torque converter access cover.
- (8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.
- (9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt

J9421-255

Fig. 13 Transmission-To-Engine Strut Attachment

- 1 - ENGINE BLOCK
- 2 - STRUT (PASSENGER SIDE)
- 3 - ENGINE MOUNT
- 4 - STRUT (DRIVER SIDE)

attaching transfer case vent tube to converter housing (Fig. 14).

(10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIV-

- 2 - CROSSMEMBER
- 3 - REAR SUPPORT AND CUSHION

ELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(12) Disconnect wires from park/neutral position switch and transmission solenoid.

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

DISASSEMBLY

(1) Clean transmission exterior with steam gun or with solvent. Wear eye protection during cleaning operations.

(2) Place transmission in a vertical position.

(3) Measure input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move the input shaft in and out. Record the maximum travel for assembly reference.

**Fig. 16 Checking Input Shaft End Play**

80c070b5

- 1 - TOOL 8266-8
- 2 - TOOL 8266-6
- 3 - TOOL C-3339

AUTOMATIC TRANSMISSION - 42RE (Continued)

(4) Remove shift and throttle levers from valve body manual lever shaft.

(5) Place transmission in horizontal position.

(6) Remove transmission oil pan and gasket.

(7) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

Fig. 17 Oil Filter Removal

- 1 - OIL FILTER
2 - VALVE BODY
3 - FILTER SCREWS (2)

(8) Remove park/neutral position switch.

(9) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

Fig. 18 Valve Body Bolt Locations

- 1 - VALVE BODY BOLTS
2 - VALVE BODY BOLTS

(10) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

(11) Remove accumulator piston and inner and outer springs (Fig. 20).

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

Fig. 19 Valve Body Removal

- 1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY
3 - PARK ROD
4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

Fig. 20 Accumulator Piston And Springs

2 - OUTER SPRING
3 - INNER SPRING

AUTOMATIC TRANSMISSION - 42RE (Continued)

(13) Loosen front band adjusting screw locknut 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 21).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 21).

Fig. 21 Removing Oil Pump And Reaction Shaft Support Assembly

- 1 - OIL PUMP AND REACTION SHAFT SUPPORT ASSEMBLY
- 2 - SLIDE HAMMER TOOLS C-3752

(17) Loosen front band adjusting screw until band is completely loose.

(18) Squeeze front band together and remove band strut (Fig. 22).

(19) Remove front band lever (Fig. 23).

(20) Remove front band lever shaft plug, if necessary, from converter housing.

(21) Remove front band lever shaft.

Fig. 22 Removing Front Band Strut

- 1 - BAND LEVER
- 2 - BAND STRUT
- 3 - FRONT BAND

Fig. 23 Removing Front Band Lever

- 1 - FRONT BAND LEVER

AUTOMATIC TRANSMISSION - 42RE (Continued)

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 24).

(23) Lift front clutch off rear clutch (Fig. 25). Set clutch units aside for overhaul.

J9121-124

Fig. 24 Removing Front/Rear Clutch Assemblies

- 1 - INPUT SHAFT
- 2 - FRONT CLUTCH
- 3 - REAR CLUTCH

- 2 - INTERMEDIATE SHAFT THRUST PLATE

AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 28 Front Band Removal**

- 1 - DRIVING SHELL
2 - FRONT BAND

(27) Remove planetary geartrain as assembly (Fig. 29). Support geartrain with both hands during removal. Do not allow machined surfaces on intermediate shaft or overdrive piston retainer to become nicked or scratched.

J9121-217

Fig. 29 Removing Planetary Geartrain And Intermediate Shaft Assembly

- 1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(28) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(29) Loosen rear band adjusting screw 4-5 turns.

(30) Remove low-reverse drum snap-ring (Fig. 30).

J9121-351

Fig. 30 Removing Low-Reverse Drum Snap-Ring

- 1 - LOW-REVERSE DRUM
2 - HUB OF OVERDRIVE PISTON RETAINER
3 - LOW-REVERSE DRUM SNAP-RING

(31) Remove low-reverse drum and reverse band.

(32) Remove overrunning clutch roller and spring assembly as a unit (Fig. 31).

J9121-222

Fig. 31 Overrunning Clutch Assembly Removal

- 1 - OVERRUNNING CLUTCH CAM
2 - REAR BAND REACTION PIN
3 - OVERRUNNING CLUTCH ASSEMBLY

AUTOMATIC TRANSMISSION - 42RE (Continued)

(33) Compress front servo rod guide about 1/8 inch with Valve Spring Compressor C-3422-B (Fig. 32).

(34) Remove front servo rod guide snap-ring. Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.

(35) Remove compressor tools and remove front servo rod guide, spring and servo piston.

80be44b7

Fig. 32 Compressing Front Servo Rod Guide

- 1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP-RING

(36) Compress rear servo spring retainer about 1/16 inch with Valve Spring Compressor C-3422-B (Fig. 33).

(37) Remove rear servo spring retainer snap-ring. Then remove compressor tools and remove rear servo spring and piston.

(38) Inspect transmission components.

NOTE: To Service the overrunning clutch cam or overdrive piston retainer, refer to the Overrunning Clutch Cam service procedure in this section.

CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and

J9121-345

Fig. 33 Compressing Rear Servo Spring

- 1 - FRONT SERVO SNAP-RING
2 - REAR SERVO SNAP-RING
3 - SPECIAL TOOL

circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and

AUTOMATIC TRANSMISSION - 42RE (Continued)

seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for assembly operations are equally clean.

Shop towels used for wiping off tools and hands must be made from **lint free** material. Lint will stick to transmission parts and could interfere with valve operation, or even restrict fluid passages.

Lubricate the transmission components with Mopar® transmission fluid during reassembly. Use Mopar® Door Ease, or Ru-Glyde™ on seals and O-rings to ease installation.

Petroleum jelly can also be used to hold thrust washers, thrust plates and gaskets in position during assembly. However, **do not** use chassis grease, bearing grease, white grease, or similar lubricants on any transmission part. These types of lubricants can eventually block or restrict fluid passages and interfere with valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and subassemblies are easily installed by hand when properly aligned.

If a part seems extremely difficult to install, it is either misaligned or incorrectly assembled. Also verify that thrust washers, thrust plates and seal rings are correctly positioned before assembly. These parts can interfere with proper assembly if mis-positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright.

(1) Install rear servo piston, spring and retainer (Fig. 34). Install spring on top of servo piston and install retainer on top of spring.

(2) Install front servo piston assembly, servo spring and rod guide (Fig. 35).

(3) Compress front/rear servo springs with Valve Spring Compressor C-3422-B and install each servo snap-ring (Fig. 36).

J9121-343

(4) Lubricate clutch cam rollers with transmission fluid.

(5) Install rear band in case (Fig. 37). Be sure twin lugs on band are seated against reaction pin.

**Fig. 37 Rear Band Installation**

- 1 - REAR BAND

(6) Install low-reverse drum and check overrunning clutch operation as follows:

(a) Lubricate overrunning clutch race (on drum hub) with transmission fluid.

(b) Guide drum through rear band.

(c) Tilt drum slightly and start race (on drum hub) into overrunning clutch rollers.

(d) Press drum rearward and turn it in clockwise direction until drum seats in overrunning clutch (Fig. 38).

(e) Turn drum back and forth. Drum should rotate freely in clockwise direction and lock in counterclockwise direction (as viewed from front of case).

**Fig. 38 Installing Low-Reverse Drum**

- 1 - REAR BAND
2 - LOW-REVERSE DRUM

AUTOMATIC TRANSMISSION - 42RE (Continued)

(7) Install snap-ring that secures low-reverse drum to hub of overdrive piston retainer (Fig. 39).

(8) Install rear band lever and pivot pin (Fig. 40). Align lever with pin bores in case and push pivot pin into place.

(9) Install planetary geartrain assembly (Fig. 41).

J9121-351

Fig. 39 Installing Low-Reverse Drum Retaining Snap-Ring

J9121-217

Fig. 41 Installing Planetary Geartrain

- 1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(10) Install thrust plate on intermediate shaft hub (Fig. 42). Use petroleum jelly to hold thrust plate in place.

J9121-215

Fig. 42 Installing Intermediate Shaft Thrust Plate

- 1 - INTERMEDIATE SHAFT HUB
- 2 - INTERMEDIATE SHAFT THRUST PLATE

AUTOMATIC TRANSMISSION - 42RE (Continued)

(11) Check seal ring on rear clutch retainer hub and seal rings on input shaft (Fig. 43). Also verify that shaft seal rings are installed in sequence shown.

(12) Install rear clutch thrust washer (Fig. 44). Use additional petroleum jelly to hold washer in place if necessary.

Fig. 43 Input Shaft Seal Ring Location

- 1 - INPUT SHAFT
- 2 - TEFLON SEAL RING
- 3 - PLASTIC SEAL RING
- 4 - REAR CLUTCH RETAINER

Fig. 44 Installing Rear Clutch Thrust Washer

- 1 - REAR CLUTCH RETAINER
- 2 - REAR CLUTCH THRUST WASHER (FIBER)

(13) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 45). Rotate front clutch retainer back and forth until completely seated on rear clutch retainer.

(14) Coat intermediate shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 46). Use enough petroleum jelly to hold

washer in place. Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub. Note thickness of this washer. It is a select fit part and is used to control transmission end play.

Fig. 45 Assembling Front And Rear Clutch Units

- 1 - TURN FRONT CLUTCH BACK & FORTH UNTIL SEATED

Fig. 46 Installing Intermediate Shaft Thrust Plate

- 1 - INTERMEDIATE SHAFT THRUST WASHER
- 2 - INPUT SHAFT
- 3 - REAR CLUTCH RETAINER HUB

AUTOMATIC TRANSMISSION - 42RE (Continued)

(15) Align drive teeth on rear clutch discs with small screwdriver (Fig. 47). This makes installation on front planetary easier.

(16) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(17) Slide front band into case.

(18) Install front and rear clutch units as assembly (Fig. 48). Align rear clutch with front annulus gear and install assembly in driving shell. Be sure output shaft thrust washer and thrust plate are not displaced during installation.

(19) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Also be sure front clutch drive lugs are fully engaged in slots of driving shell after installation.

Fig. 47 Aligning Rear Clutch Disc Lugs

- 1 - REAR CLUTCH DISCS
- 2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

J9121-124

Fig. 48 Installing Front/Rear Clutch Assemblies

- 1 - INPUT SHAFT
- 2 - FRONT CLUTCH
- 3 - REAR CLUTCH

J9121-197

Fig. 49 Front Band Linkage Installation

- 1 - BAND LEVER
- 2 - BAND STRUT
- 3 - FRONT BAND

(20) Assemble front band strut.

(21) Install front band adjuster, strut and adjusting screw (Fig. 49).

(22) Tighten band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

AUTOMATIC TRANSMISSION - 42RE (Continued)

(23) Check seal rings on reaction shaft support hub. Verify that seal rings are hooked together and that front clutch thrust washer is properly positioned (Fig. 50). Use petroleum jelly to hold thrust washer in place if necessary.

(24) Lubricate oil pump body seal with petroleum jelly. Lubricate pump shaft seal lip with petroleum jelly.

(25) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump bore flange (Fig. 51).

(26) Align and install oil pump gasket (Fig. 51).

Fig. 50 Reaction Shaft Support Seal Rings And Front Clutch Thrust Washer

- 1 - REACTION SHAFT SUPPORT HUB
- 2 - FRONT CLUTCH THRUST WASHER
- 3 - SEAL RINGS

Fig. 51 Installing Pilot Studs And Oil Pump Gasket

- 1 - OIL PUMP GASKET
- 2 - PILOT STUD TOOLS C-3288-B

(27) Install oil pump (Fig. 52). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install 2 or 3 pump bolts to hold pump in place.

(28) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

Fig. 52 Installing Oil Pump

- 1 - OIL PUMP
- 2 - PILOT STUD TOOL
- 3 - PILOT STUD TOOL

(29) Measure input shaft end play (Fig. 53).

NOTE: If end play is incorrect, transmission is incorrectly assembled, or the intermediate shaft thrust washer is incorrect. The intermediate shaft thrust washer is selective.

- (a) Attach Adapter 8266-6 to Handle 8266-8.
- (b) Attach dial indicator C-3339 to Handle 8266-8.
- (c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.
- (d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
- (e) Move input shaft in and out and record reading. End play should be 0.56-2.31 mm (0.022-0.091 in.). Adjust as necessary.
- (30) Install accumulator piston and inner and outer springs (Fig. 54).
- (31) Verify that valve body solenoid harness is secured in 3-4 accumulator housing cover plate.
- (32) Install valve body as follows:

AUTOMATIC TRANSMISSION - 42RE (Continued)

80c070b5

Fig. 53 Checking Input Shaft End Play

- 1 - TOOL 8266-8
- 2 - TOOL 8266-6
- 3 - TOOL C-3339

80c072b8

Fig. 54 Accumulator Piston And Springs

- 1 - GOVERNOR PRESSURE SENSOR
- 2 - VALVE BODY
- 3 - PARK ROD
- 4 - ACCUMULATOR PISTON
- 5 - GOVERNOR PRESSURE SOLENOID

(a) Align and carefully insert park rod into pawl. Rod will make click noise as it enters pawl. Move rod slightly to check engagement.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case. Also be sure valve body wiring is not pinched or kinked.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into the cavity.

(33) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(34) Adjust front and rear bands.

(35) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

(36) Install magnet in oil pan. Magnet goes on small protrusion at corner of pan.

(37) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(38) Install new valve body manual shaft seal in case (Fig. 55). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

RH272

Fig. 55 Installing Manual Lever Shaft Seal

- 1 - 15/16" SOCKET
- 2 - SEAL

(39) Install throttle valve and shift selector levers on valve body manual lever shaft.

AUTOMATIC TRANSMISSION - 42RE (Continued)

INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 56). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

Fig. 56 Checking Converter Seating - Typical

1 - SCALE

2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(20) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to 31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(27) Adjust gearshift linkage and throttle valve cable if necessary.

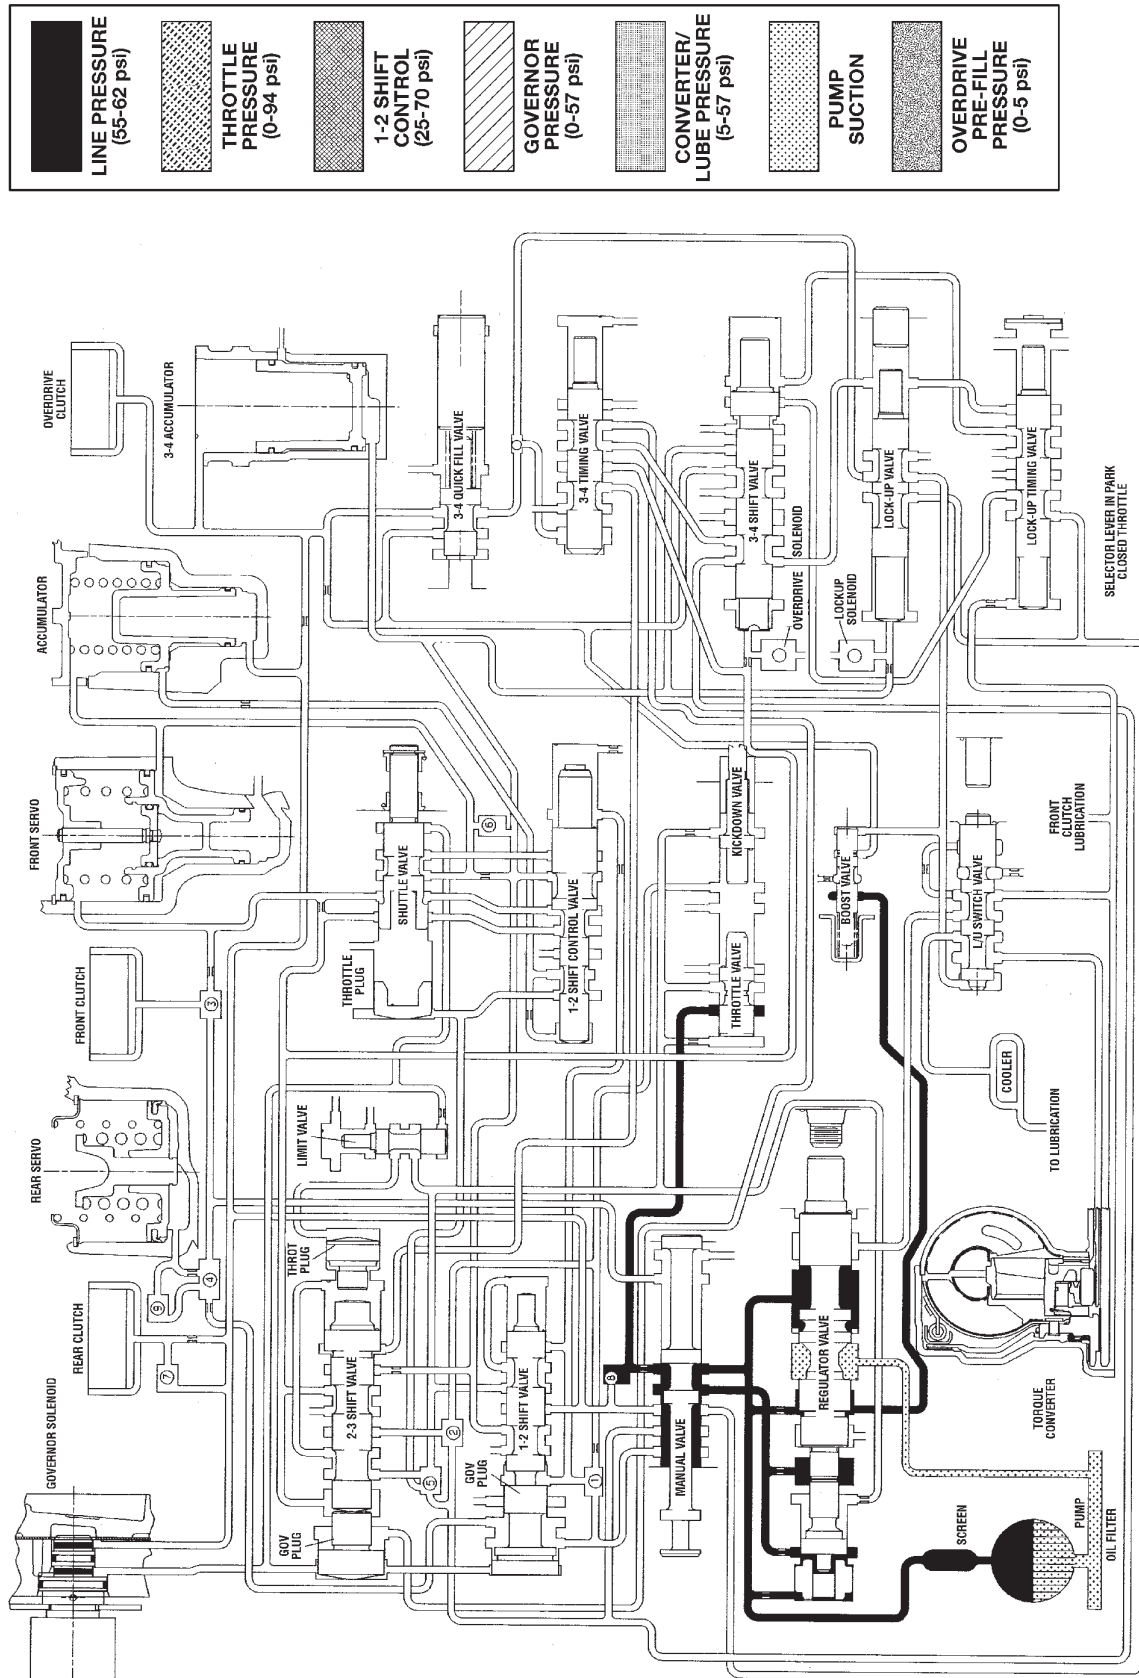

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

AUTOMATIC TRANSMISSION - 42RE (Continued)

PRESSURE TEST

Overdrive clutch	Fourth gear only	Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle.
Line pressure (at accumulator)	Closed throttle	372-414 kPa (54-60 psi).
Front servo	Third gear only	No more than 21 kPa (3 psi) lower than line pressure.
Rear servo	1 range R range	No more than 21 kPa (3 psi) lower than line pressure. 1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm.
Governor	D range closed throttle	Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 57) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 58).

Fig. 57 Accumulator

- 1 - ACCUMULATOR PISTON

Fig. 58 3-4 Accumulator and Housing

- 1 - ACCUMULATOR PISTON
- 2 - 3-4 ACCUMULATOR HOUSING
- 3 - TEFLON SEALS
- 4 - PISTON SPRING
- 5 - COVER PLATE AND SCREWS

OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 59), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 60), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

NOTE: The accumulator is shown in the inverted position for illustrative purposes.

INSPECTION

Inspect the accumulator piston and seal rings (Fig. 61). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 61). Replace the springs if the coils are cracked, distorted or collapsed.

BANDS

DESCRIPTION

KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 62) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

80a3b192

Fig. 62 Front Band

- 1 - FRONT BAND
- 2 - TRANSMISSION HOUSING

LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 63) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

OPERATION

KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

BANDS (Continued)

- 2 - LOCKNUT
- 3 - LEVER
- 4 - REAR BAND
- 5 - REACTION PIN
- 6 - O-RINGS
- 7 - PIVOT PIN

LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

ADJUSTMENT - BANDS**FRONT BAND**

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 64). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and appropriate Torx™ socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 3 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.
- (6) Lower vehicle.

**Fig. 64 Front Band Adjustment Screw Location**

- 1 - LOCK-NUT
- 2 - FRONT BAND ADJUSTER

REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns (Fig. 65). Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque.

**Fig. 65 Rear Band Adjusting Screw Location**

- 1 - ADJUSTING SCREW
- 2 - REAR BAND LEVER
- 3 - LOCKNUT

- (5) Back off adjusting screw 4 turns.
- (6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

BANDS (Continued)

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(8) Lower vehicle and refill transmission with Mopar® ATF +4, type 9602, fluid.

ELECTRONIC GOVERNOR

DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 66).

J9321-408A

Fig. 66 Governor Pressure Solenoid Valve

- 1 - SOLENOID FILTER
2 - GOVERNOR PRESSURE SOLENOID

GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 67).

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 67).

80c072af

Fig. 67 Governor Pressure Sensor

- 1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, -1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

ELECTRONIC GOVERNOR (Continued)

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output valves are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the "cold" period of operation.

GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

GOVERNOR PRESSURE CURVES

LOW TRANSMISSION FLUID TEMPERATURE

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade "hunting" prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine "flare." The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

ELECTRONIC GOVERNOR (Continued)

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove transmission fluid pan and filter.
- (3) Disengage wire connectors from pressure sensor and solenoid (Fig. 68).

- 1 - GOVERNOR BODY
- 2 - GASKET

ELECTRONIC GOVERNOR (Continued)

INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace o-ring seals, clean the gasket surfaces and replace gasket.

- (1) Place gasket in position on back of governor body (Fig. 72).
- (2) Place governor body in position on valve body.
- (3) Install bolts to hold governor body to valve body.

Fig. 72 Governor Body and Gasket

- 1 - GOVERNOR BODY
2 - GASKET

- (4) Lubricate o-ring on pressure sensor with transmission fluid.
- (5) Align pressure sensor to bore in governor body.
- (6) Push pressure sensor into governor body.
- (7) Lubricate o-ring, on pressure solenoid, with transmission fluid.
- (8) Align pressure solenoid to bore in governor body (Fig. 73).

EXTENSION HOUSING BUSHING

REMOVAL

- (1) Remove extension housing yoke seal.
- (2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 76).

80a11095

Fig. 76 Bushing Removal - Typical

- 1 - REMOVER
- 2 - EXTENSION HOUSING BUSHING

INSTALLATION

- (1) Align bushing oil hole with oil slot in extension housing.
- (2) Tap bushing into place with Installer 6951 and Handle C-4171.
- (3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 77).

J9521-58

Fig. 77 Extension Housing Seal Installation

- 1 - SPECIAL TOOL C-3995-A OR C-3972-A
- 2 - SPECIAL TOOL C-4471

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Seal Remover C-3985-B (Fig. 78) from overdrive housing.

J9521-57

Fig. 78 Removing Overdrive Housing Yoke Seal

- 1 - SPECIAL TOOL C-3985-B
- 2 - SEAL

INSTALLATION

- (1) Place seal in position on overdrive housing.
- (2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 79).
- (3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

FLUID AND FILTER

DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

FLUID AND FILTER (Continued)

PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 80) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not over-fill.

PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

804d8ede

Fig. 80 Dipstick Fluid Level Marks - Typical

1 - DIPSTICK

2 - MAXIMUM CORRECT FLUID LEVEL

3 - ACCEPTABLE FLUID LEVEL

(5) Hook up DRB® scan tool and select engine.

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the figure. (Fig. 81)

(9) Adjust transmission fluid level shown on the dipstick according to the figure.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

(10) Check transmission for leaks.

Fig. 81 42/44RE Fluid Fill Graph

80a3bfba

FLUID AND FILTER (Continued)

STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

- (1) Hoist and support vehicle on safety stands.
- (2) Place a large diameter shallow drain pan beneath the transmission pan.
- (3) Remove bolts holding front and sides of pan to transmission (Fig. 82).
- (4) Loosen bolts holding rear of pan to transmission.
- (5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
- (6) Hold up pan and remove remaining bolt holding pan to transmission.
- (7) While holding pan level, lower pan away from transmission.
- (8) Pour remaining fluid in pan into drain pan.
- (9) Remove screws holding filter to valve body (Fig. 83).
- (10) Separate filter from valve body and pour fluid in filter into drain pan.
- (11) Dispose of used trans fluid and filter properly.

Fig. 82 Transmission Pan

- 1 - TRANSMISSION
